Cognitive & behavioural symptoms in ALS

**Why are they there
and how to assess them?**

Samostojnost!

Cognitive & Motor Symptoms in ALS: Why are they there?

- Because ALS is not a motor disorder
- Cognitive & behavioural symptoms are there not despite by because of ALS being a disease of the motor system

Is it a new topic (since C9ORF72)?

The two narratives of ALS:

- ALS as a motor disorder
- Cognitive/behavioural symptoms only recently recognised

But

- Cognitive/behavioural symptoms documented since 19th C
- Explicit link between ALS and FTD made in 1932

The nature of the deficits

- Intellectual impairment
 - “Merkfähigkeit” vs. “Gedächtnis”, preserved visuo-spatial skills
- Language:
 - “Speechlessness”, Spelling errors, Comprehension deficits
- Changes in personality & behaviour:
 - Suspiciousness, greed, tendency to hoard things
 - Apathy, irritability, emotional lability
- Psychotic symptoms:
 - Delusions & hallucinations

Cognitive & behavioural symptoms in ALS: *dementia or mild cognitive dysfunction?*

Single case reports of overt Dementia

Dornblüth 1889

Meyer 1929

von Braunmühl 1932

Teichmann 1935

Subtle cognitive changes in non-demented patients

Marie 1892

Raymond & Cestan 1905

Van Bogaert 1925

Ziegler 1930

How frequent?

- Marie (1892)
 - “psychic disturbances are fairly common”
- Raymond & Cestan (1905)
 - Half of 18 pathologically confirmed cases described as “psychologically feeble”
- Van Bogaert (1925)
 - “psychic alterations” in 13 out of 31 patients

The tale of two traditions

Dornblüth 1889

Büscher 1922

Marie 1892

van Bogaert 1925

Watanabe 1893

Meyer 1929

Raymond & Cestan 1905

Ziegler 1930

Fragnito 1907

von Braunmühl 1932

Westphal 1909

Wechsler & Davison 1932

Gerbert & Naville 1921

Teichmann 1935

Neurodegenerations as diseases of functional systems

- Relatively focal onset (anatomically & clinically)
- A systematic spread of the disease (-> *John Ravits*)
- “What wires together, dies together”
(*Bak & Chandran, Cortex 2012*)
- What is the motor system?

Namibia 2016

Re-thinking the motor system

Before we execute any movement we have to:

- Have the intention to do it (initiative, generation)
- Select the correct motor pattern (action semantics)
- Suppress it if necessary (e.g. socially inappropriate)

All this could be referred to as “motor cognition”
(Marc Jeannerod 2006)

Cognition/behavioural symptoms in MND

- Behaviour: Apathy & Desinhibition
- Generation of words, concepts etc
- Decision making, knowledge of actions, social cognition
- => Deficits in “Motor cognition”
- Distinct from (opposite to) the deficits seen in SD
- Extension of Hebb's Rule (*Bak & Chandran 2011*):
 - What fires together wires together
 - What wires together dies together

FTD & ALS: one, two of three diseases (2010)

■ 2001 - ALS and FTD:

- Coincidence
- Co-occurrence
- Continuum

■ 2010 - Specific features of ALS/FTD:

- Psychotic features (*Bak, Lillo, Snowden*: particularly in C9ORF72)
- Comprehension deficits (*Caselli, Rakowicz, Bak, Goldstein*)
- Spelling errors (*Watanabe, Kawamura, Silani, Abrahams & Bak*)
- Does not map neatly into bvFTD, NFPA and SD

■ => Interaction rather than addition

Why & how to assess cognition & behaviour in ALS?

- Heterogeneity of patients: “ALS patients” vs. “Normal controls” assumes homogeneity => subgroups
- Heterogeneity of functions: cognitive functions dissociate => selective deficits => multidimensionality
- Motor deficits confound cognitive performance:
 - Dysarthria, mutism – oral performance
 - Weakness, spasticity, apraxia – written performance
 - => tests minimising motor confounds

Cognitive screening across the world

92% use regularly screening tools, often more than one:

- 62% MMSE
- 36% MoCA
- 20% ACE
- 14% CDR
- 5% Clock drawing
- 3.2% DRS
- 3% FAB

All these tests are substantially influenced by motor deficits.

Edinburgh Cognitive Screen (ECAS)

- Cognitive assessment for patients with motor deficits
- Tries to minimise the influence of motor dysfunction (e.g. pointing tasks, yes/no answers etc)
- Parallel written and spoken versions
- Multi-dimensional
- First applied in ALS, currently piloted in PD & PSP

ECAS – LANGUAGE

■ Naming

■ Comprehension:

ECAS – EXECUTIVE FUNCTIONS

■ Reverse Digit Span

■ Alternation

■ Inhibition (Hayling)

EXECUTIVE – Reverse Digit Span

○ Say: 'I am going to say some numbers and I would like you to say them back to me in reverse order. For example, if I say '2 3 4', you should say '4 3 2'. Let's have a practice. If I say '7 1 9', what would you say?' Stop when person gets both trials of a line wrong. Score total number of trials correct.

Score
0-12

Trial		Check	Trial		Check
1	2 6		2	5 8	
3	9 3 5		4	4 1 6	
5	7 2 8 4		6	9 5 7 3	
7	6 9 4 2 1		8	8 3 2 5 6	
9	8 1 3 5 7 9		10	3 6 2 7 3 4	
11	1 6 9 3 5 8 6		12	2 3 6 8 4 9 2	

EXECUTIVE – Alternation

○ Say: 'I want you to alternate between numbers and letters, starting with 1-A, then 2-B, 3-C, and so on. Please continue from there, alternating between numbers and letters, in order, without skipping any until I tell you to stop'.

Score
0-12

Trial	Check	Trial	Check	Trial	Check	Trial	Check
1	4-D	2	5-E	3	6-F	4	7-G
5	8-H	6	9-I	7	10-J	8	11-K
9	12-L	10	13-M	11	14-N	12	15-O

EXECUTIVE – Fluency Letter T

○ Say: 'I am going to give you a letter of the alphabet and I would like you to say or write as many words as you can beginning with that letter, but not names of people or places, or numbers. This time the word must only be four letters long. No more or less than four letters'

- If writing, say: 'You will have two minutes. The letter is T.'
- If speaking, say 'You will have one minute. The letter is T.'

No. of correct words
=

Time to copy/
read aloud
=

○ Next the person copies/reads these words aloud.

- If writing, say: 'copy these words as fast as possible. I will time you. Ready? Begin.'
If speaking, say: 'read aloud these words as fast as possible. Before you do this, check that you can read them. I will time you. Ready? Begin.'

Verbal Fluency Index (VFI) calculation:

If spoken:

$$VFI = \frac{60 \text{ seconds} - \text{no. of seconds to read aloud words}}{\text{No. of correct words generated}}$$

If written:

$$VFI = \frac{120 \text{ seconds} - \text{no. of seconds to copy words}}{\text{No. of correct words generated}}$$

ECAS Subdomains: Frequency of Abnormal Performance (75 ALS patients)

75
Patients

- *The ECAS had less ceiling effects than the ACE-III*

- IQ predicts 23% of the variance of the total score of the ECAS vs 46% of the ACE-III*

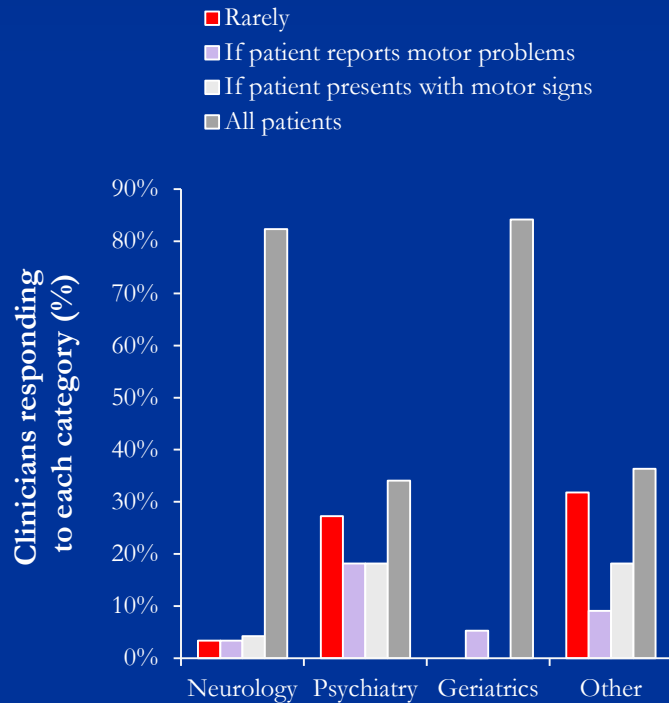

Behaviour: don't ask, don't hear

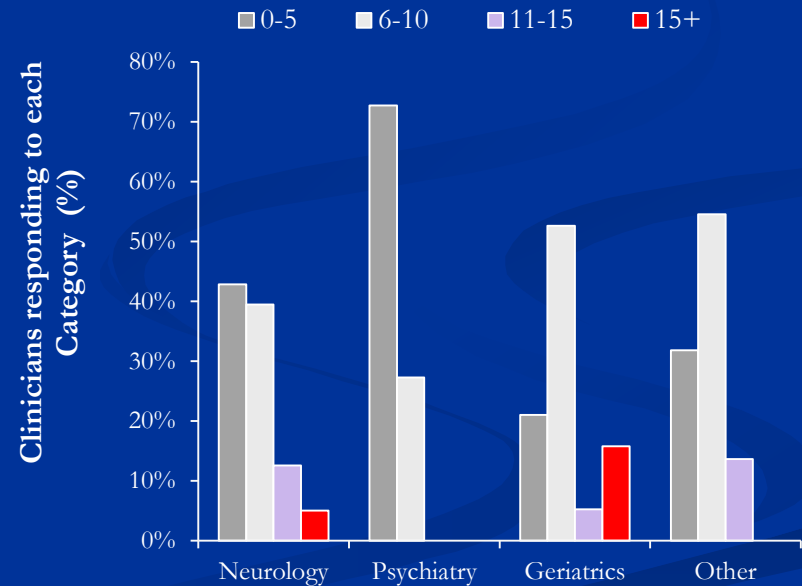

- The typical Natural course of behavioural & cognitive symptoms in ALS: psychosis -> dementia -> ALS
- Patients & carers unlikely to report apparently unrelated symptoms spontaneously
- Until recently, many continental (and Japanese) neurologists were also psychiatrists => seeing the same patients for psychiatric & neurological problems

Motor examination in dementia: current practice

Frequency with which a motor exam is conducted

Reported duration of motor examination (minutes)

Summary

- The motor system does not start at the motor cortex, it includes all aspects of **motor cognition**
- => Cognitive & behavioural symptoms are an integral part of the clinical picture of ALS
- Their assessment needs to be multidimensional and to control for motor dysfunction

Hvala za pozornost
