Issues in ALS

Lack of “marker(s)” for:

1. Disease diagnosis
2. Disease prognosis
3. Treatment response

Purpose of the study

To develop a **computational method to systematically evaluate spinal cord metabolism** as a tool to monitor disease mechanisms.

Methods

30 spinal-onset ALS patients were enrolled in the study.

Data obtained in the patients were compared with data from **30 control subjects without any history of neurodegenerative disease.**

Patients underwent, after **FDG administration**, a 3D whole-body scan using an integrated **PET/CT scanner.**

Methods

Spinal canal and spinal cord districts were **defined anatomically** considering:

- **Cervical segment:** the region **between the skull base** and the plane adjacent to the **caudal face of the C7** vertebral body.
- **Dorsal segment:** the district **between the caudal face of C7** and the one adjacent **to the caudal face of D12**.

Methods

Hough transform and recognition of lines from satellite pictures.

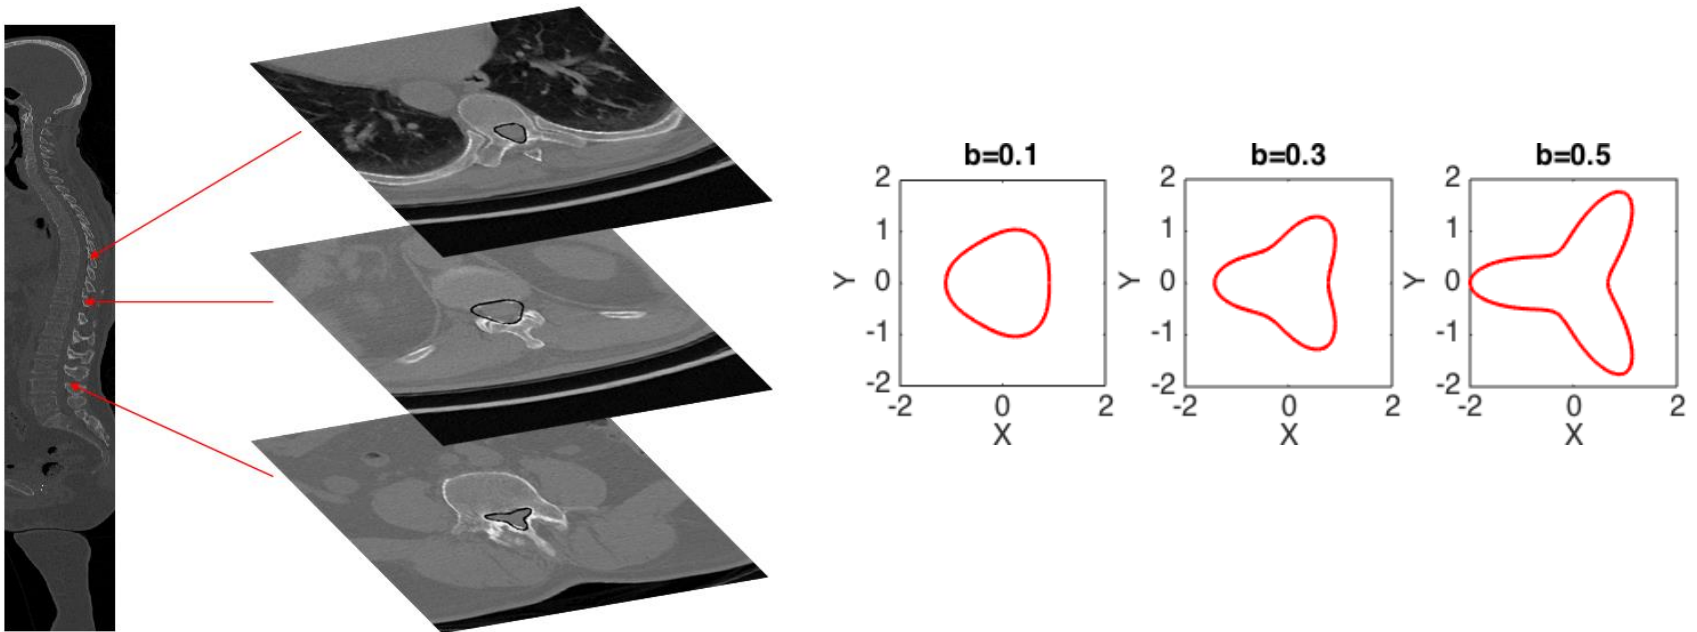

Methods

Masks for each CT slices were then created using Hough transform and:

- **Curves with three convexities** for optimal detection of the **spinal canal**:

$$C_{a,b} : (x^2 + y^2)^3 = (a(x^2 + y^2) - b(x^3 - 3xy^2))^2$$

Methods

Masks for each CT slices were then created using Hough transform and:

- **Curves with three convexities** for optimal detection of the **spinal canal**:

$$C_{a,b} : (x^2 + y^2)^3 = (a(x^2 + y^2) - b(x^3 - 3xy^2))^2$$

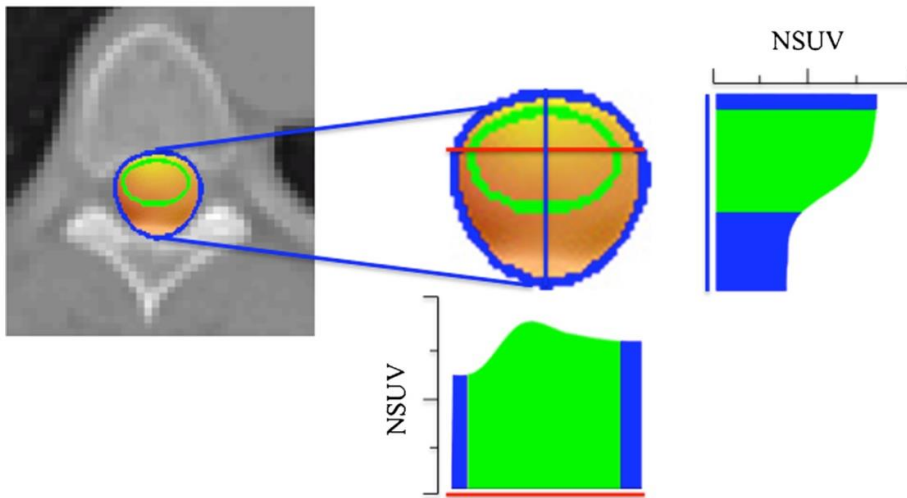

- Four-parameter **ellipses** for identification of the **spinal cord district**:

$$E_{a,b,c,d} : b^2(x-c)^2 + a^2(y-d)^2 - a^2b^2 = 0$$

Methods

^{18}F -FDG standardized uptake values were measured to estimate the metabolic activity of the spinal canal and cord.

$$SC_NSUV = \frac{(C_NSUV \times \text{cervical SC volume}) + (D_NSUV \times \text{dorsal SC volume})}{\text{cervical SC volume} + \text{dorsal SC volume}}$$

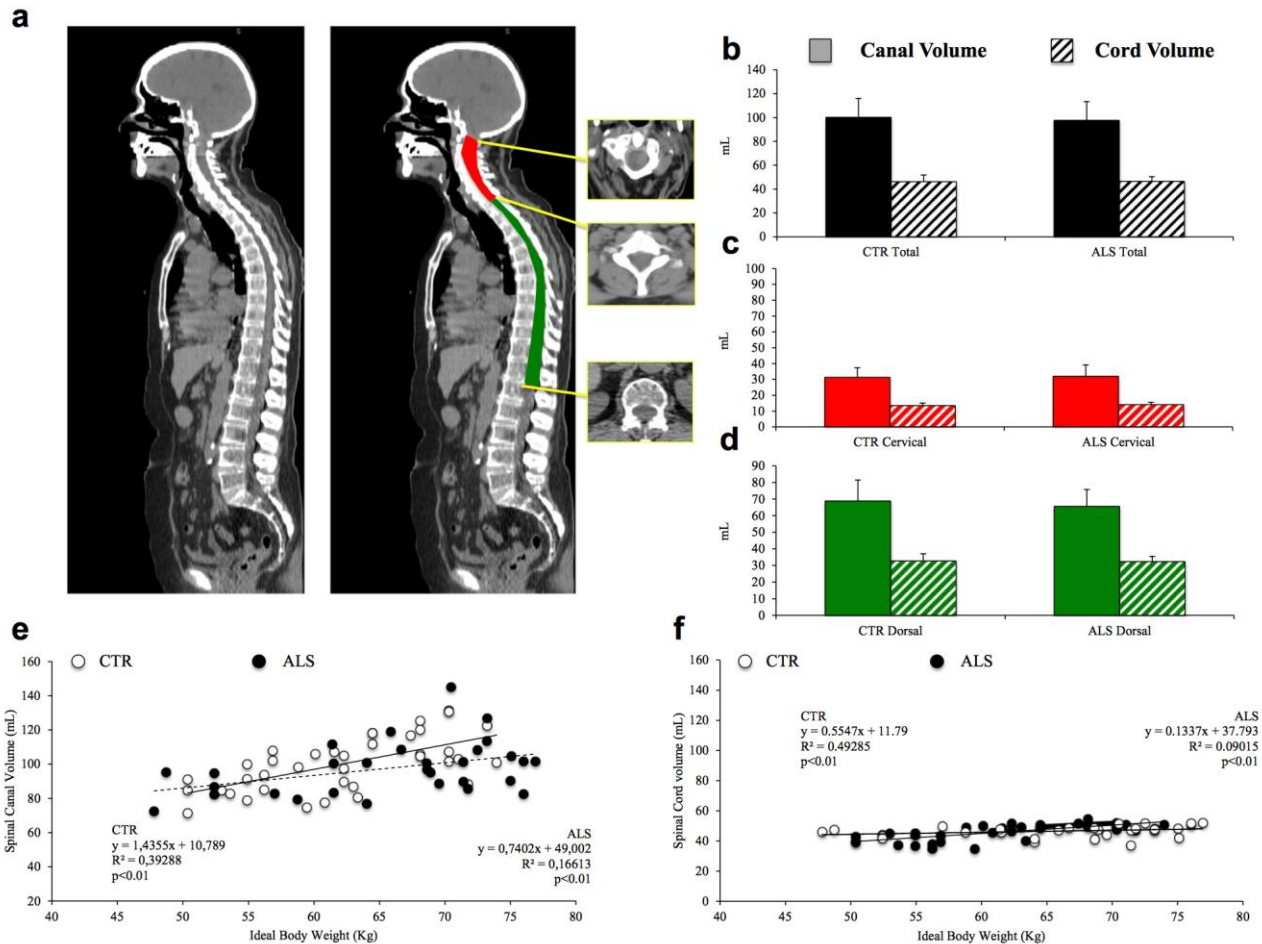

Results (1)

Clinical characteristics of the patients and controls:

Characteristic	Control subjects	ALS patients
Age (years)		
Mean \pm SD	60 \pm 13	66 \pm 11
Median (range)	59 (33 – 79)	69 (34 – 82)
Number of subjects		
Men	20	20
Women	10	10
Ideal body weight (kg), mean \pm SD	66 \pm 9	66 \pm 9
Time from ALS diagnosis to PET/CT (months)		
Mean \pm SD	–	18 \pm 15
Median (range)	–	17 (2 – 69)
ALS functional rating scale score		
Mean \pm SD	–	39 \pm 5
Median (range)	–	39 (20 – 46)
Riluzole therapy, <i>n</i>	–	21
Serum glucose (mg/dL)		
Mean \pm SD	98 \pm 13	102 \pm 12
Median (range)	100 (73 – 130)	98 (69 – 129)
Follow-up after PET/CT (months)		
Mean \pm SD	24	14 \pm 7
Median (range)	–	16 (1 – 36)
Number of deaths during follow-up	0	13

Results (2)

Shape and volume of spinal canal and spinal cord:

Results (2)

Shape and volume of spinal canal and spinal cord:

No significant differences were observed in spinal cord and spinal canal volumes between the two groups.

Results (3)

Spinal canal and spinal cord metabolic activity:

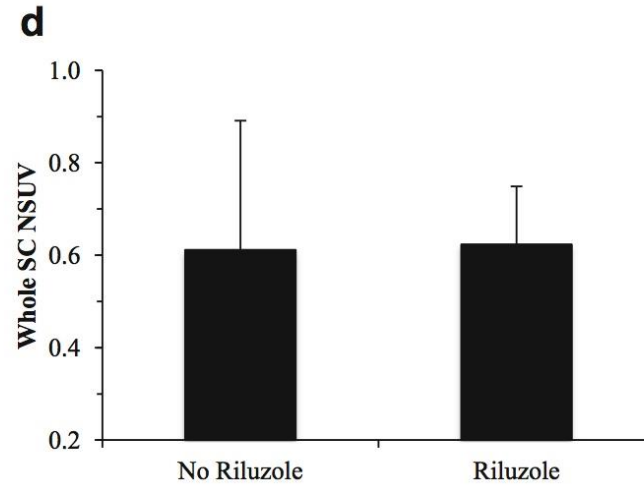

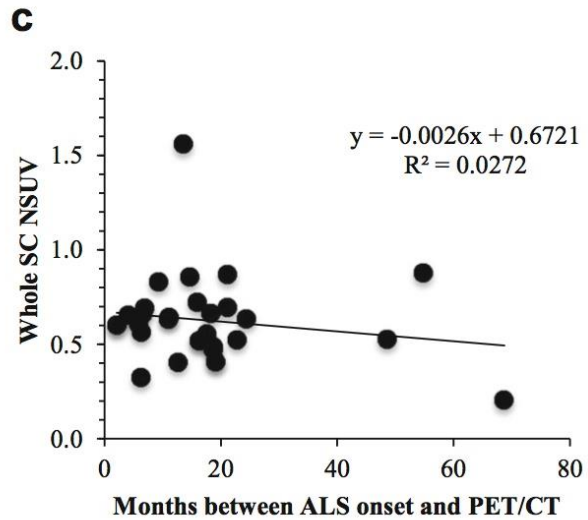

Results (3)

Spinal canal and spinal cord metabolic activity:

F-FDG in the spinal cord was significantly higher in patients than in controls ($p < 0.05$).

Results (4)

Results (4)

^{18}F -FDG uptake was completely independent of age, gender, degree of functional impairment, disease duration and riluzole treatment.

Results (5)

Spinal cord metabolic pattern and patient outcomes:

Results (5)

Spinal cord metabolic pattern and patient outcomes:

Kaplan-Meier analysis showed a **higher mortality rate** in patients with standardized **uptake values above the fifth decile** at the 3-year follow-up evaluation (log-rank test, $p < 0.01$).

Conclusions

This new method enabled the evaluation of spinal cord metabolism and volume and **might represent a potential new window onto the pathophysiology of ALS**

The observation of a **relative increase FDG uptake might reflect inflammatory mechanisms** rather than the expected consequences of motor neuron loss and subsequent spinal cord atrophy.

Perspectives

- A new study is currently enrolling** patients (50 pts.) in order to:
- optimize image analysis.
 - confirm the putative prognostic/diagnostic role of spinal cord (hyper)metabolism in ALS.
 - dissect spinal cord metabolism and functional disability.

Future

A role of **spinal cord (FDG) PET/CT** in clinical trials
to assess **treatment response?**
