Antigen presenting cells (APCs) present pathogen fragments via their major histocompatibility complex (MHC)

→ Discrimination between self and foreign peptides

The T-cell receptor signalling complex

T cells detect presented antigen with the T-Cell Receptor (TCR) protein complex

→ Discrimination between self and foreign peptides

The T-cell receptor signalling complex

Huppa et al., *Nature* (2010)

Single molecule FRET experiments yielded interaction life times of ~ 100 ms.

→ Discrimination between self and foreign peptides

The T-cell receptor signalling complex

A single (antigenic) pMHC molecule is able to activate a T cell

→ Incredible T-cell specificity and sensitivity

Huang et al., Immunity (2013)

Huppa et al., Nature (2010)

The T-cell receptor signalling complex

Stoichiometry of the TCR/CD3 signaling complex

A single (antigenic) pMHC molecule is able to activate a T cell

→ Incredible T-cell specificity and sensitivity

Huang et al., Immunity (2013)

Huppa et al., Nature (2010)

Model system for studying T-cells

- ICAM-1 on SLBs
(90% POPC + 10% DGS-NTA(Ni))

Replace antigen presenting cell (APC) by a 2D-supported lipid bilayer (SLB) system

Model system for studying T-cells

- ICAM-1 on SLBs (90% POPC + 10% DGS-NTA(Ni))
- Murine T cell blasts, day 7-9
- 1:1 stoichiometric TCR labeling

Replace antigen presenting cell (APC) by a 2D-supported lipid bilayer (SLB) system

Huppa et al., *Nature* (2010)

Model system for studying T-cells

- ICAM-1 on SLBs (90% POPC + 10% DGS-NTA(Ni))
- Murine T cell blasts, day 7-9
- 1:1 stoichiometric TCR labeling
- TIRF imaging

Replace antigen presenting cell (APC) by a 2D-supported lipid bilayer (SLB) system

Model system for studying T-cells

TIRF imaging of AlexaFluor568-H57-scF_v bound to 5c.c7 T cells (blasted)

Laterally Mobile TCR/CD3 Complexes Feature One TCR β and Two CD3 ϵ Subunits

TOCCSL experiment – Thining Out Cluters while Conserving Stoichiometry of Labeling

TCR oligomers at the initial contact of T-cells with bilayer ?

FRET – Förster Resonance Energy Transfer Experiments

Initial signaling events

Conclusions

TOCCSL, PA/FCS & FRET experiments

No indication for other stoichiometry than one $\alpha\beta$ TCR per complex

i. **Mobile fraction:** TOCCSL, two color-TOCCSL, single-molecule FRET and Photon-Antibunching FCS experiments

ii. **Immobile fraction:** FRET between TCRs, FRET between pMHCs

iii. **Activation via pMHC:** FRET between TCRs, FRET between pMHCs

iv. **Early signaling events:** ZAP70 recruitment and FRET btw. TCRs.

v. **Late signaling events:** FRET between TCRs, FRET between pMHCs

Nature Reviews | Immunology

Conclusions

TOCCSL, PA/FCS & FRET experiments

No increased FRET signal in TCR-enriched microclusters

Active separation of TCRs in microclusters

- **Monomeric TCRs are responsible for the activation of T-cells, not TCR oligomers**
- **Models for explaining high sensitivity/specificity still needed**

Brameshuber et al., Nature Immunology (2018), 19 (5), 487-96
