

# The multiple roles of Orai N-terminus in CRAC channel function

- Introduction
- Techniques
  - Results
- Summary

STIM1 and Orai - the main players in store-operated  $\text{Ca}^{2+}$  channels

# Ca<sup>2+</sup> is a major factor regulating cellular processes

**major Ca<sup>2+</sup> entry pathway mediated by store-operated Ca<sup>2+</sup> channels**

# Store-Operated-Channel (SOC)

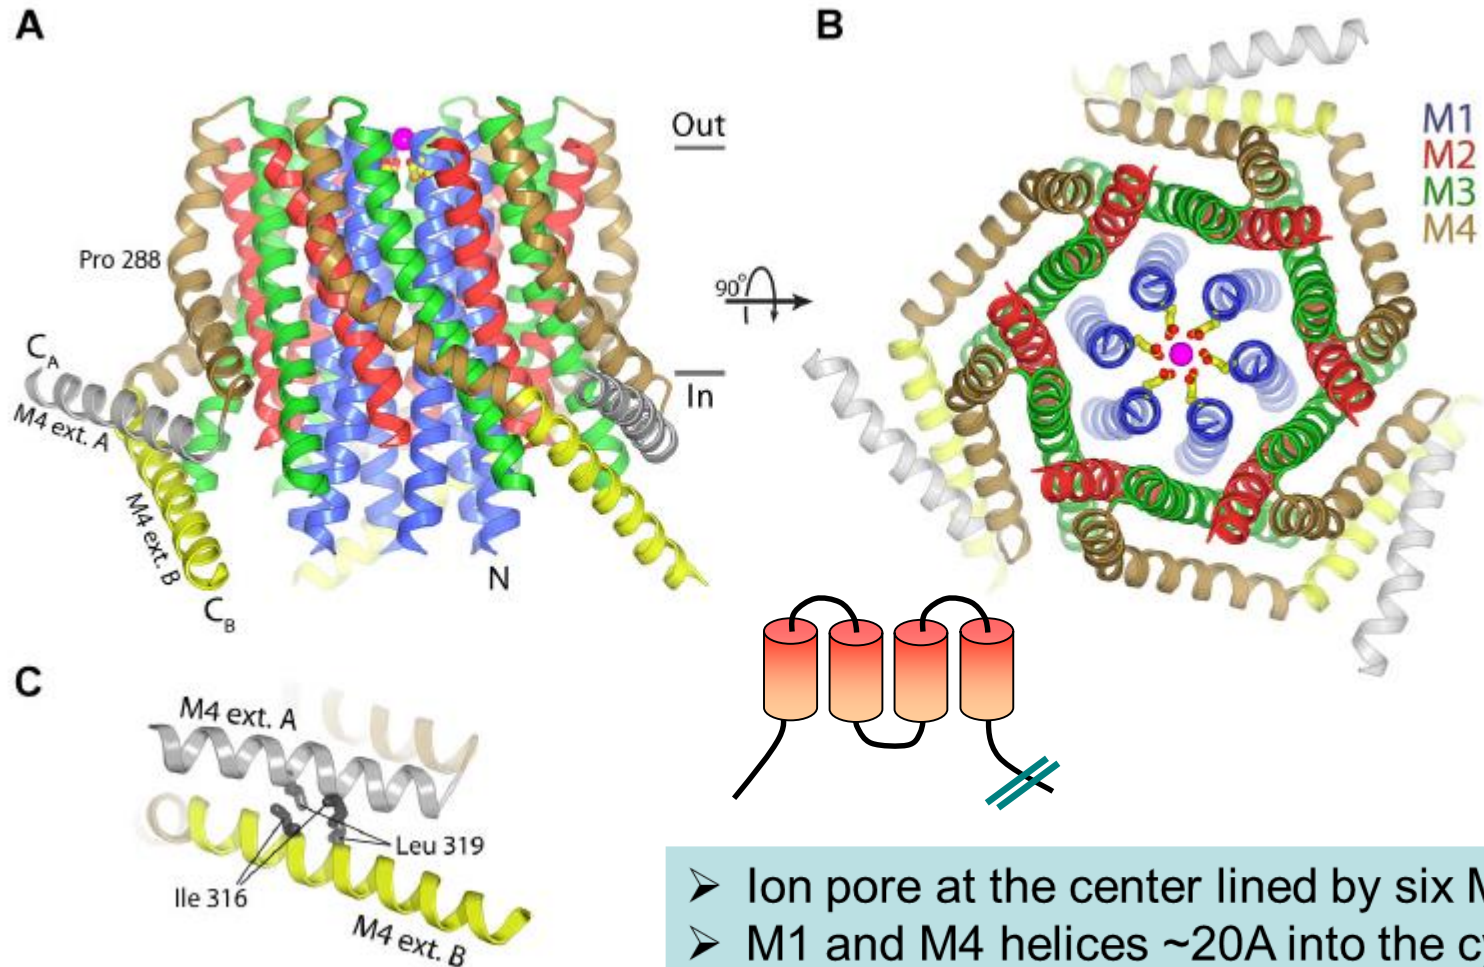

- SOC is dependent on the  $[Ca^{2+}]$  in the stores
- store depletion triggers SOC activation

STIM1

Orai

# CRAC channel - STIM1 - Orai1

Hou et al., Science 2012

- Ion pore at the center lined by six M1
- M1 and M4 helices ~20Å into the cytosol
- M4 extension of Orai1A/B pack into pairs involving L316 (L273) and L319 (L276)

- Introduction
- Techniques
  - Results
- Summary

- Patch Clamp Technique
- Fluorescence Resonance Energy Transfer (FRET) Microscopy

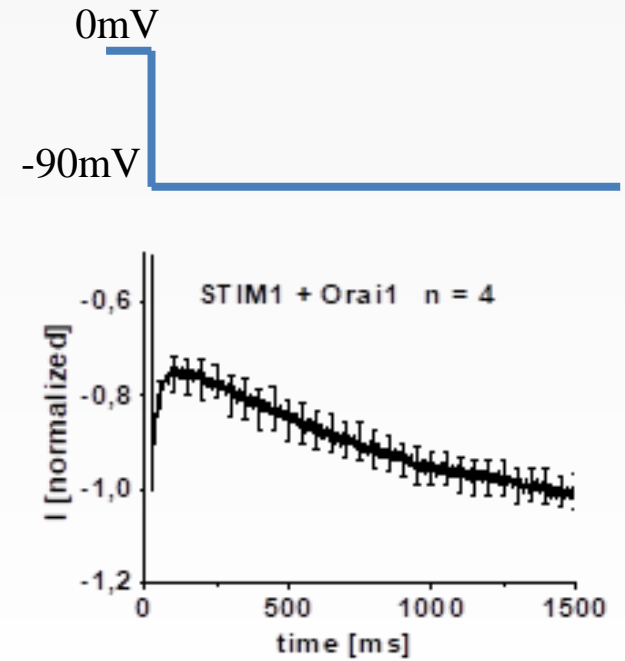

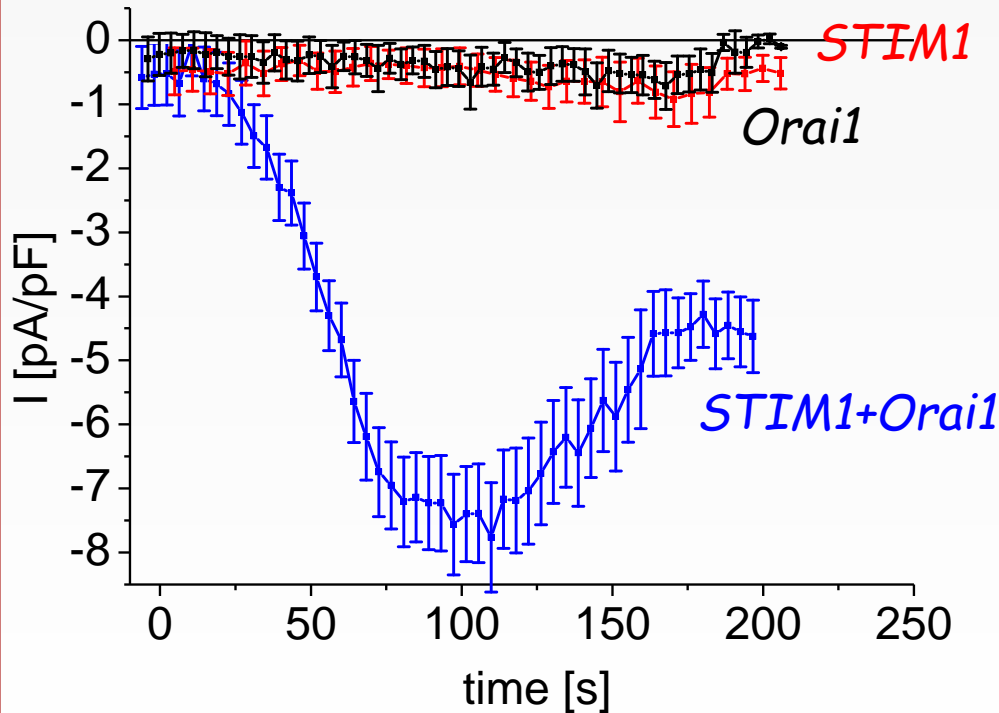

# Activation of store-operated Orai1 channels

STIM1 and Orai1 over-expression in HEK cells

-> Store depletion in HEK cells co-expressing STIM1 and Orai1 activates store-operated  $\text{Ca}^{2+}$  currents

# STIM1 and Orai1 required for channel activity

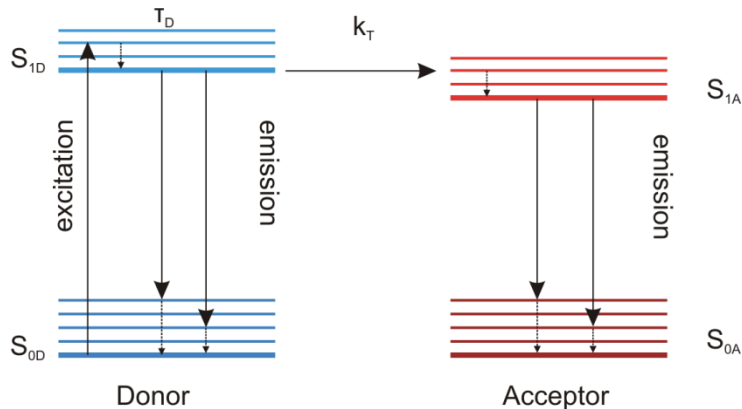

-> Co-expression of STIM1 and Orai1 activates of store-operated  $Ca^{2+}$  currents

- Introduction
- Techniques
  - Results
- Summary

- Patch Clamp Technique
- Fluorescence Resonance Energy Transfer (FRET) Microscopy

# Förster Resonance Energy Transfer (FRET)

- FRET is the radiationless transfer of emission energy from a donor to an acceptor that occurs beyond a distance of 10 nm.

**Nice technique to detect protein-protein interactions**

- Cyan and yellow fluorophores are used from *Aequorea victoria* – keeper of GFP

- A pixel per pixel readout allows a time-dependent measurement of FRET within a single cell

- Introduction

# Gating of Orai1 is further controlled via a communcation of N-terminus with cholesterol

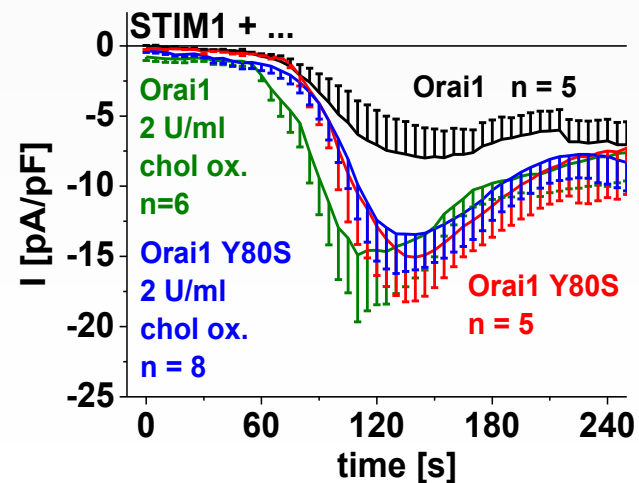

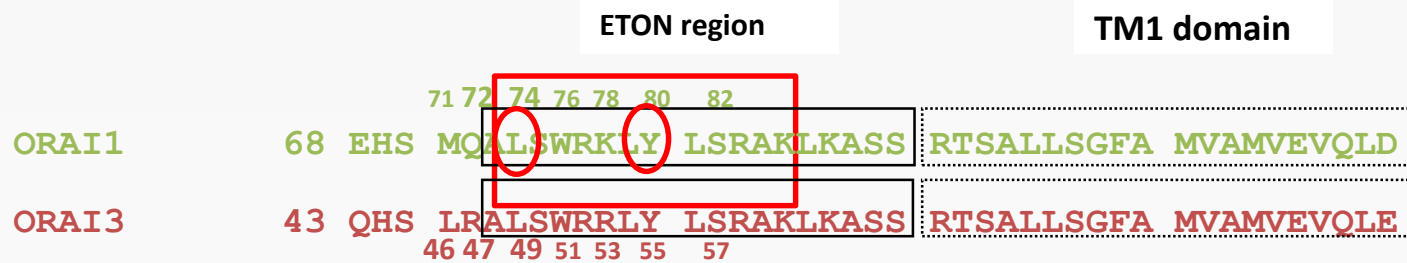

(L/V)-X<sub>1-5</sub>-(Y)-X<sub>1-5</sub>-(K/R) – consensus motif of cholesterol binding motif

Derler et al., Sci Signal; 2016

# Gating of Orai1 is further controlled via a communcation of N-terminus with cholesterol

Derler et al., Sci Signal; 2016

# Cholesterol binding is affected by a mutated Orai1 N-terminus

Derler et al., Sci  
Signal; 2016

# Conclusion

1. Upon STIM1 multimerisation, it couples directly to Orai1 via coiled-coil domains in punctae structures.
2. Binding results in Calcium influx via Orai1 channels
3. Orai1 C-terminus is main binding site for STIM1
4. Orai1 N-terminus:
  - Control STIM1 coupling partly
  - Essential for store-operated activation
  - Controls CRAC channel hallmarks
  - Controls distance to Orai1 loop2
  - Is involved in cholesterol mediated Orai regulation.
