PERFORMANCE ENHANCING

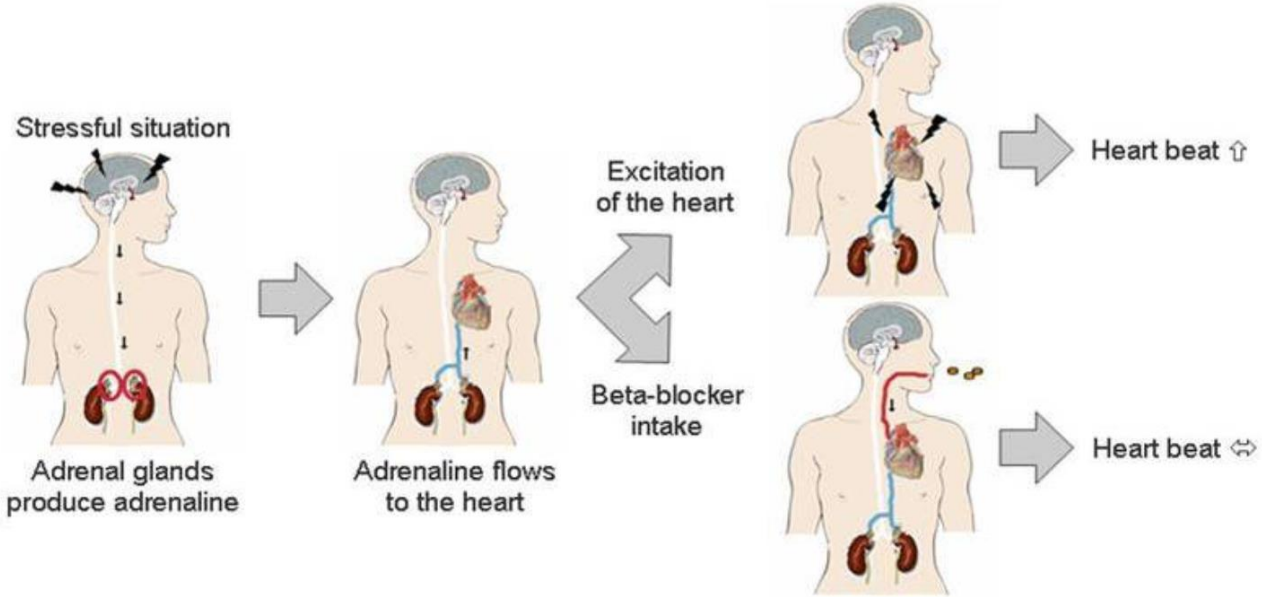
DOPING IN MUSIC?

Can we use certain substances to improve our music performance?

Beta-blockers (reduce the effects of adrenaline and noradrenaline as the consequence of fear, performance anxiety)

- **increased heart rate**
- **tremor**
- **sweating**
- **vibrating voice**
- **dizziness, vertigo**

Example of doping protocol for the musicians:
5-20 mg propranolol/ performance;
60-90 min before (start protocol)



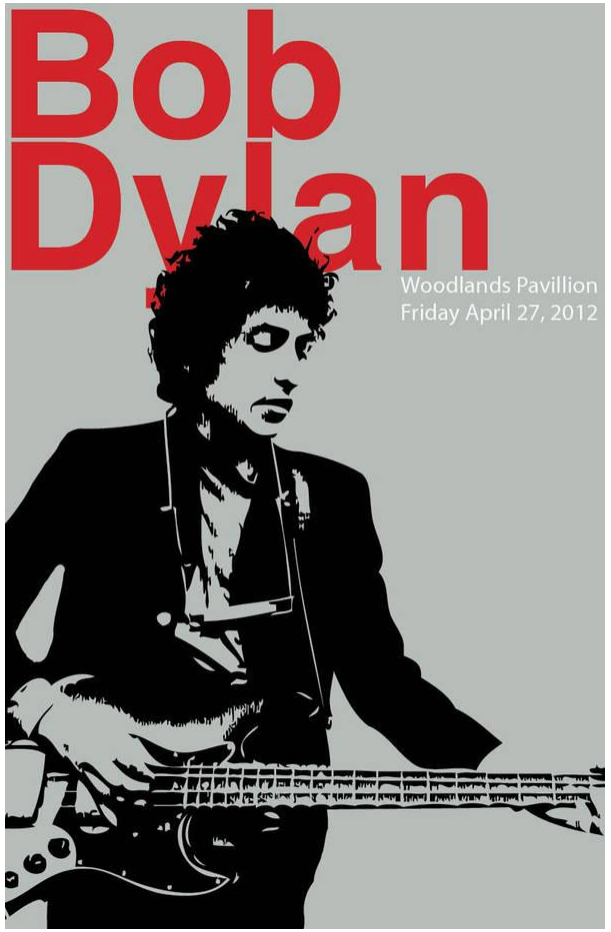
The Musician's Steroid: The Controversy Surrounding Beta Blockers

"Some of my teachers in conservatory days would gladly carry around a flask of Scotch and take it before they went on stage," she said. "But I don't see that in any of the orchestras that I've played in recently."

Instead, Mulcahy and other orchestra musicians increasingly turn to beta blockers. According to Mulcahy and other musicians who spoke with WQXR, in some backstage areas, they're passed around like chewing gum or mints. Mulcahy recalls panicked colleagues calling "Oh my God, does anybody have any Inderal?"

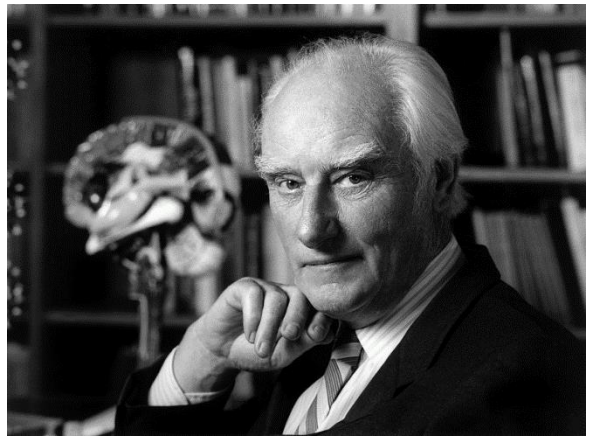
URL: http://www.wqxr.org/#!/story/312920-musicians-use-beta-blockers-relieve-stage-fright/

DOPING IN ART – PSYCHODELIC SUBSTANCES FOR IMPROVED CREATIVITY

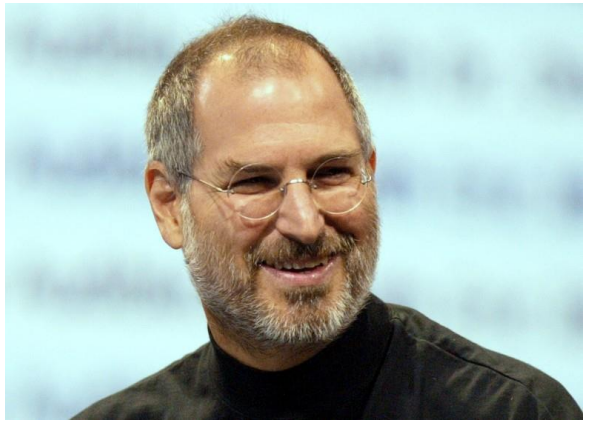


DOPING IN SCIENCE? IN INNOVATION?

Can we increase our creativity and thinking?

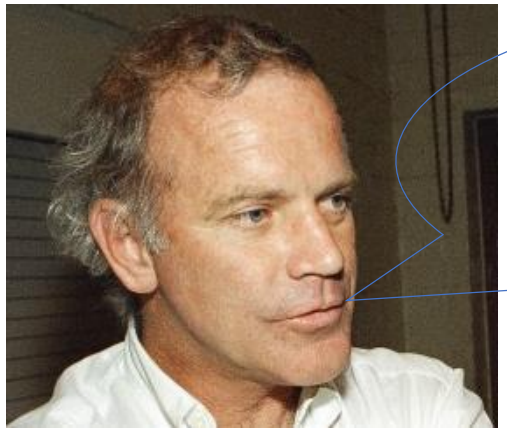


FRANCIS CRICK – discovery of DNA. Nobel Prize in Medicine awarded in 1962. Used **LSD** with researcher at University of Cambridge – also during the discovery.



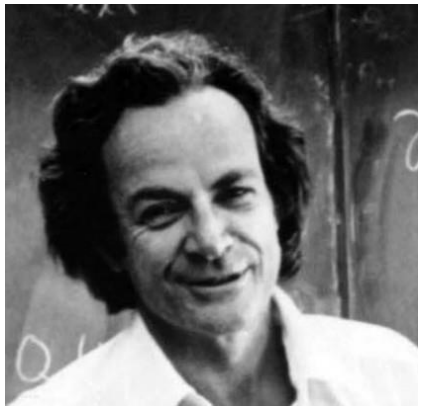
STEVE JOBS – founder of Apple. In years 1972-1974 used **LSD**.

BILL GATES – founder of Microsoft. Used **LSD** in the age <25 years.



KARY MULLIS – developed PCR. Nobel prize in chemistry in 1993. **LSD**

"What if I had not taken LSD ever; would I have still invented PCR? I don't know. I doubt it. I seriously doubt it."



RICHARD FEYNMAN, USA physicist, Nobel prize in physics in1965.
LSD, marijuana, ketamine.

MICRODOSE DOPING TO INCREASE PRODUCTIVITY AS „CREATIVITY ENHANCERS“

Protocol 1:
10-15 µg LSD (10% „normal dose“)

Protocol 2:
taking sub-perceptual doses (6-25 microgram LSD, 0.2-0.5 gram dried mushrooms, 50-75 microgram mescaline HCL

CREATIVITY ENHANCERS

Purpose: to improve „out-of-the-box-thinking“

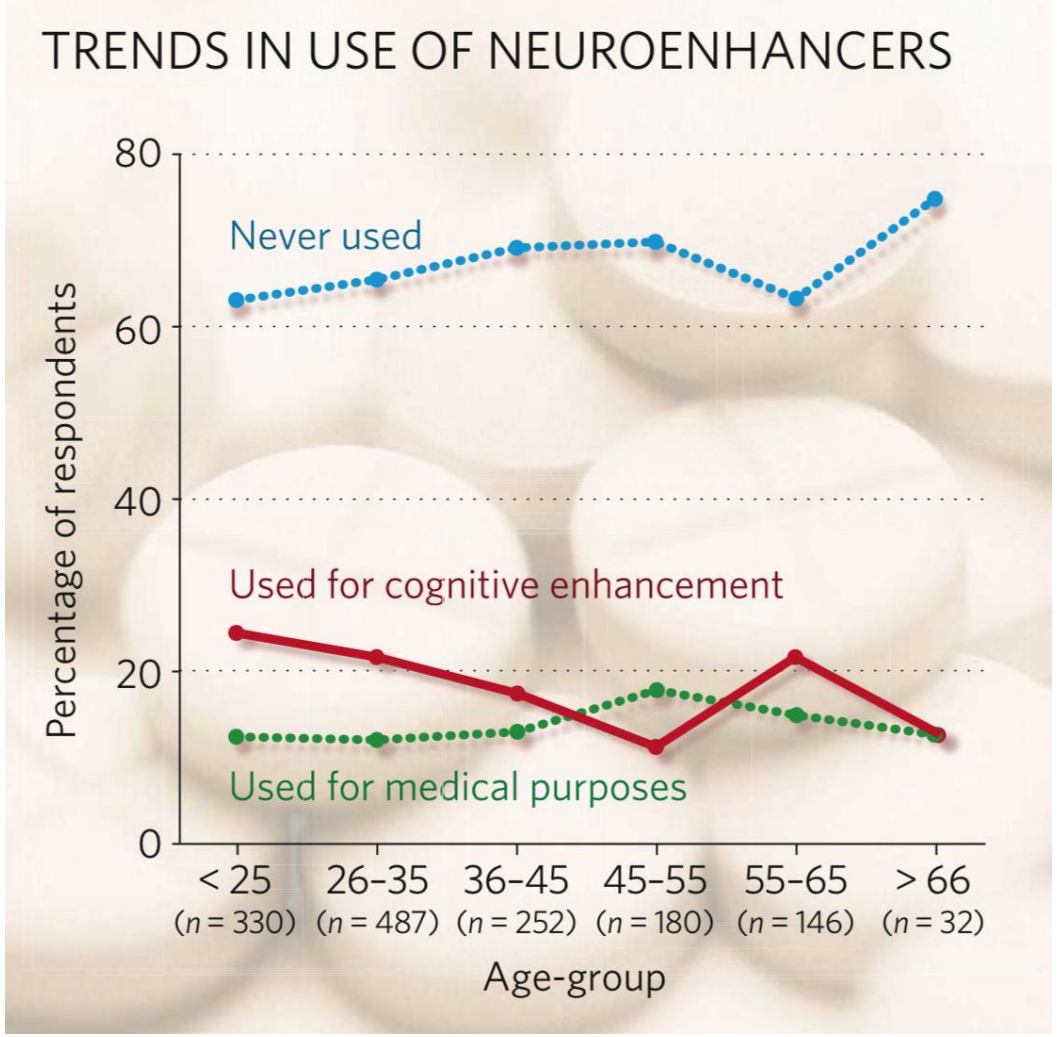
Silicon Valley professionals are taking LSD at work to increase productivity

An increasing number of twenty-somethings are reportedly 'micro-dosing' on psychedelic drugs - and they say it's making them better workers

USE IN ACEDEMIC FIELD – ACADEMIC DOPING



1400 researchers from 60 countries

3 substances as academic doping:

- **modafinil: 62 %**
- **methylphenidate: 44 %**
- **beta-blockers: 15 %**

All 3 are <u>prohibited in sports</u> (by WADA).

Sevilla's Puerta dies in hospital

Spain international Antonio Puerta has died after suffering a heart attack in his club side Sevilla's 4-1 win against Getafe on Saturday.

Puerta helped Sevilla win the Uefa Cup last season

Defender Puerta, 22, collapsed in the first-half and medics prevented him from swallowing his tongue.

But he collapsed again after going off and was given cardiac resuscitation before being taken to hospital.

He was placed in intensive care and doctors said on Tuesday his condition had deteriorated before his death.

Puerta collapsed after jogging back towards his own goal 35 minutes into the opening league game of the season at the Sanchez Pizjuan on Saturday.

Belgian rider Sermon dies in sleep

Updated: February 15, 2004, 6:39 AM ET

BRUSSELS, Feb 15 - Belgian cyclist Johan Sermon has died in his sleep at the age of 21, news agency Belga reported.

Sermon, of the Daikin team, appeared to have died of natural causes, Belga quoted team manager Ernest De Vuyst as saying.

"An autopsy has been carried out and we are now awaiting the results. But I can already say with certainty it was a natural death," said De Vuyst, who added that he believed Sermon had died of heart failure.

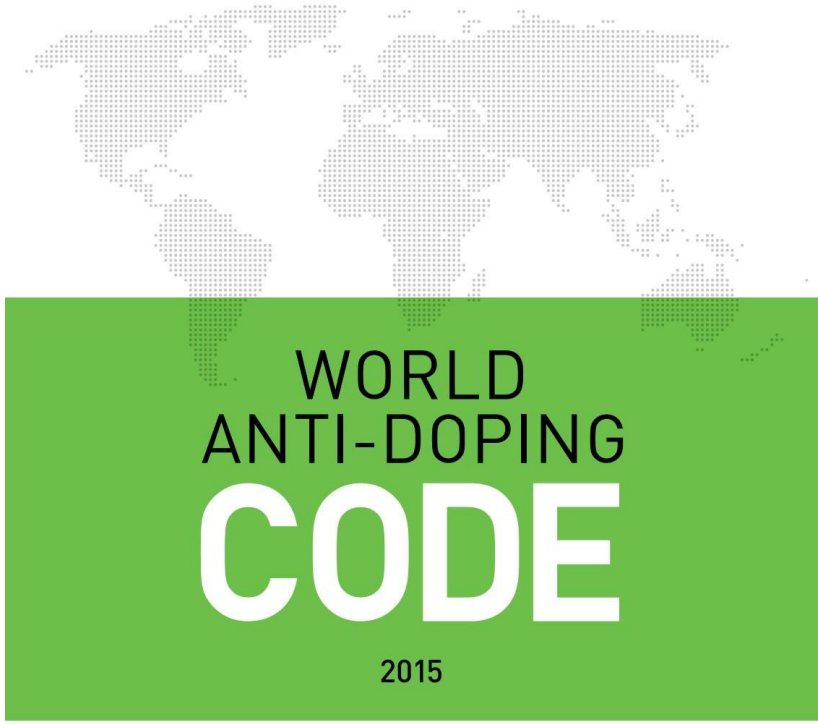
Former Tour de France winner Marco Pantani was found dead in a hotel room in Italy at the weekend.

Belga quoted former French Minister of Youth and Sports Marie-George Buffet as saying: "I am devastated by the announcement of the deaths of Marco Pantani and Johan Sermon."

21 years of age, heart arrest during the sleep – 15th February 2004

What is doping in sports?

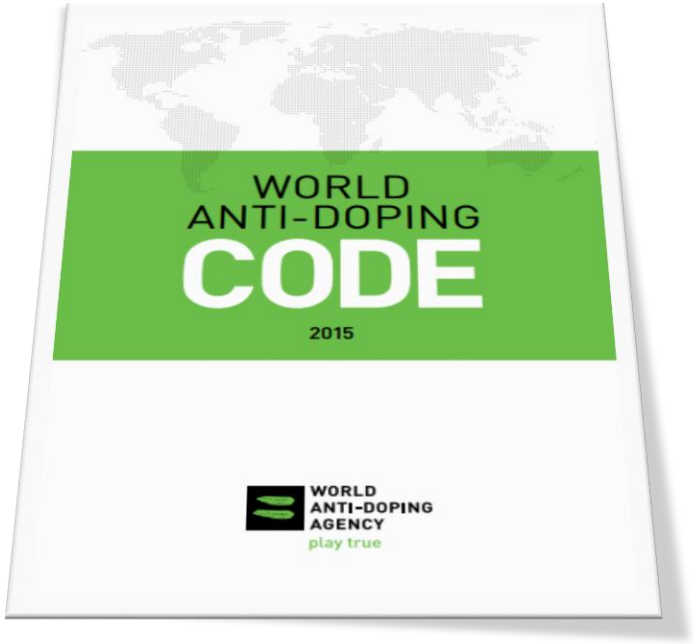
Doping is defined as the occurrence of one or more of the **anti-doping rule violations.**



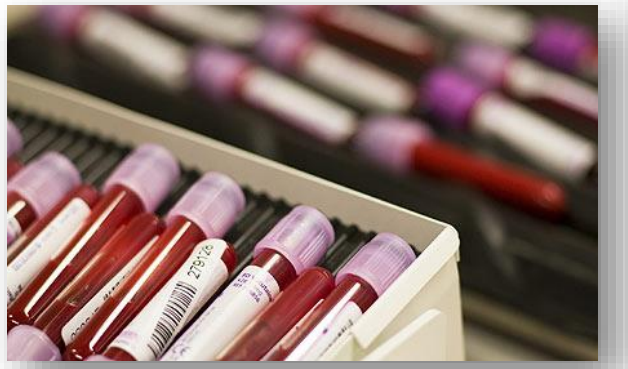
WORLD ANTI-DOPING AGENCY
play true

The current official definition of doping is given based on the World Anti-Doping Code.

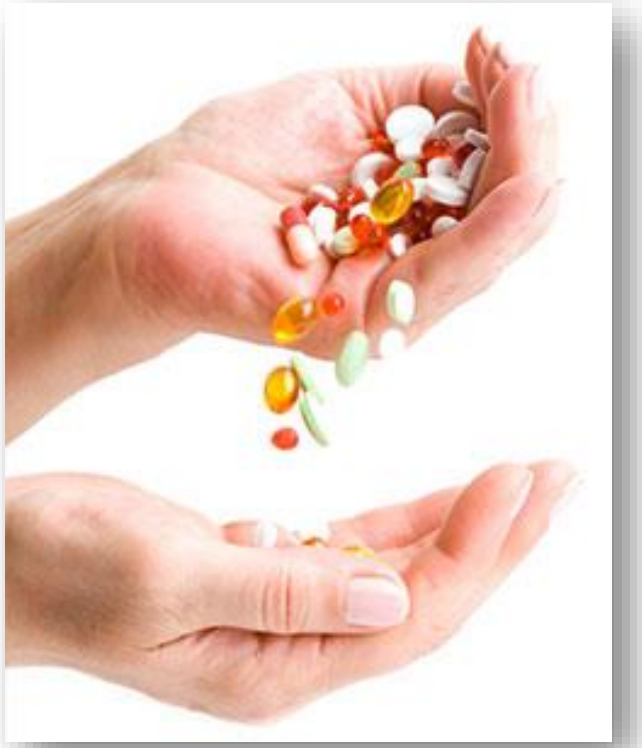
1) Presence of a prohibited substance or its metabolites or markers in an athlete's sample



- substances and methods which have been included on the Prohibited List



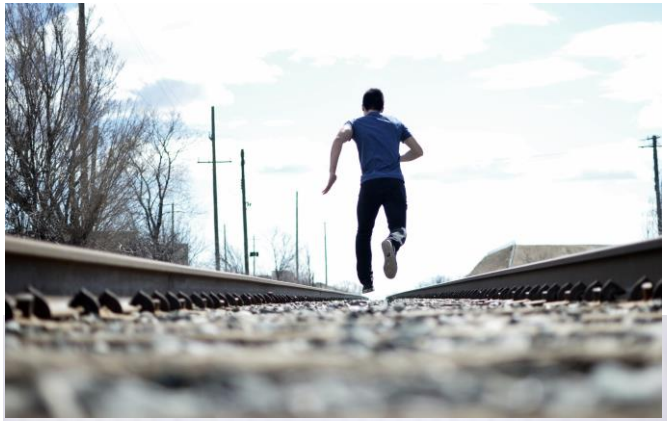
2) Use or Attempted Use by an Athlete of a Prohibited Substance or a Prohibited Method



- it is each athlete's personal duty to ensure that no prohibited substance enters his or her body and that no prohibited method is used
- the success or failure of the use or attempted use of a prohibited substance or prohibited method is not important

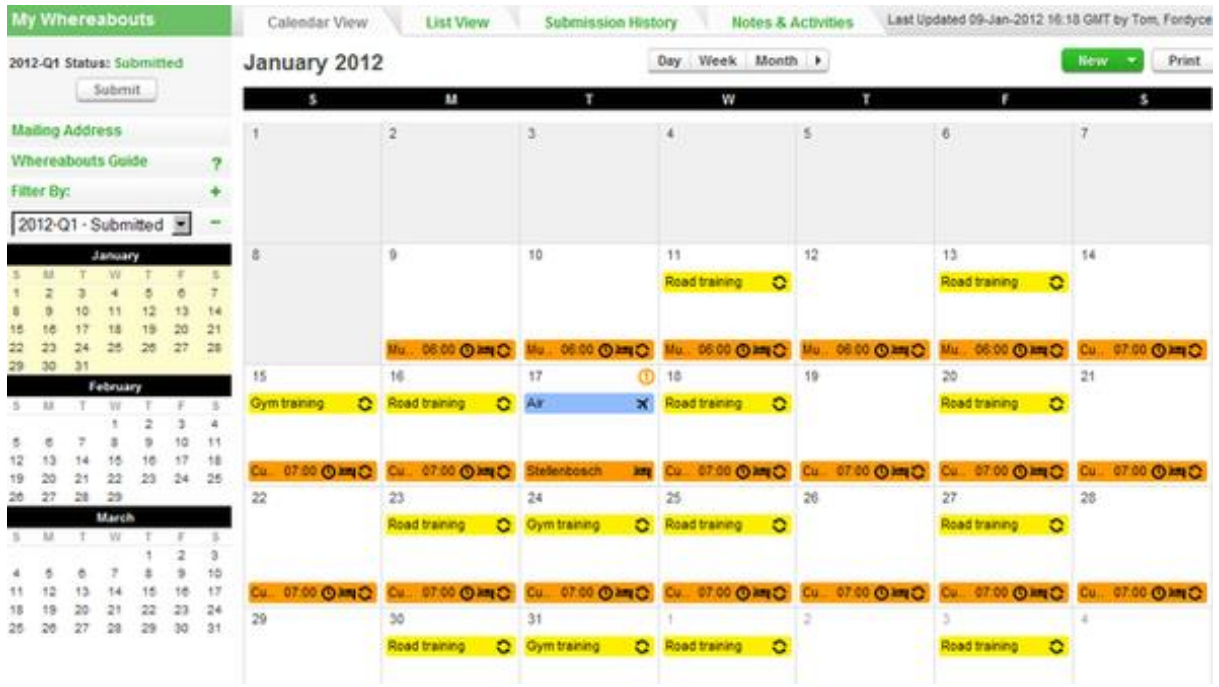
3) Evading, Refusing or Failing to Submit to Sample Collection

- **evading sample collection**, or without compelling justification, **refusing or failing to submit to sample collection** after notification as authorized in applicable anti-doping rules



4) Whereabouts Failures

- Any **combination of three missed tests and/or filing failures**, as defined in the International Standard for Testing and Investigations, **within a 12-month period** by an Athlete in a Registered Testing Pool.



5) Tampering or Attempted Tampering with any part of Doping Control

- intentionally interfering or attempting to interfere with a Doping Control official,
- providing fraudulent information to an Anti-Doping Organization,
- intimidating or attempting to intimidate a potential witness

- Including: altering identification numbers on a Doping Control form during Testing, breaking the B bottle at the time of B Sample analysis, or altering a Sample by the addition of a foreign substance

6) Possession of a Prohibited Substance or a Prohibited Method

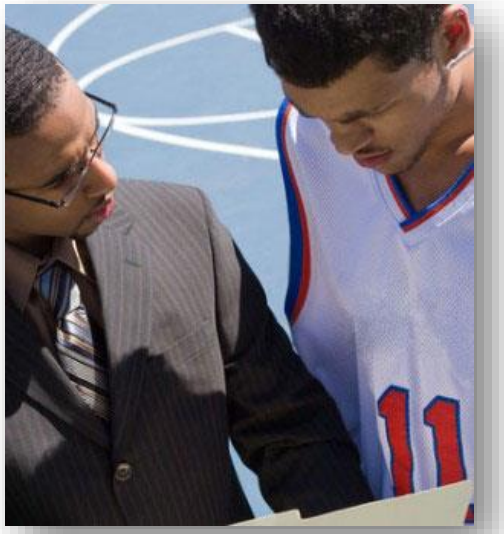
- possession by an athlete of any prohibited substance or any prohibited method on both in-competition and out-of-competition period

- exceptions are substances, which are used *for therapeutic purposes*

- valid for **both athletes and athlete support person**

7) Trafficking or Attempted Trafficking in any Prohibited Substance or Prohibited Method

8) Administration or Attempted Administration to any Athlete of any Prohibited Substance or Prohibited Method



- In-competition, and out-of-competition
- help, advisorory role, induction, covering up, …
- national Crime laws

e.g. in SLOVENIA:

Kazenski zakonik (KZ-1) – 186. člen in 187.člen (od 1.novembra 2008)

9) Complicity

- assisting, encouraging, aiding, abetting, conspiring, covering up or any other type of intentional complicity involving an anti-doping rule violation,

10) Prohibited Association

Association by an Athlete to any personnel, which is:

- serving a period of Ineligibility
- convicted or found in a criminal, disciplinary or professional proceeding to have engaged in conduct which would have constituted a violation of anti-doping rules if Code-compliant rules had been applicable to such Person
- serving as a front or intermediary for an individual described above (intermediary person)

In Italy a 55 year-old was caught for doping in an amateur race. The rider for Team Marlis won a race in the category for 55 to 59 year-olds, but CONI, the Italian Olympic committee, announced that the amateur racer was caught for using stimulants, according to *La Gazzetta dello sport*. He is facing a suspension until he turns 57 as well as a revoking of his title.

Table 3 Period prevalence of doping in various target groups using randomised response technique questionnaires

Publication	Target group	*n*	Prevalence of doping (%)
Pitsch et al. [79]	Adult elite	448	26–48 Ever; 20–39 Last year
Striegel et al. [72]	Junior elite	480	3–11 Ever
Simon et al. [81]	Fitness centre visitors	500	8–17 Ever
Stubbe et al. [80]	Fitness centre visitors	447	5–23 Last year

Table 4 Overview of estimates of the period prevalence of doping amongst elite athletes based on different analysis techniques

Analysis techniques	Estimated prevalence	Remarks
Doping control test results	1–2 % Last year [15]	Stable figure for the last 25 years. Not likely to reflect true intentional doping (see Sect. 2.1)
Population estimates based on biological value parameters	14 % Over 10 years [36]	Blood manipulations in elite athletes in athletics; data on other sorts of doping or sports modalities as yet unavailable (see Sect. 2.2)
Standard questionnaires	1–15 % [4, 45–59]	Mostly performed on adolescents and/or students; little research in elite sports (see Sect. 3.1)
Randomised response questionnaires	20–39 % Last year (adult) [79] 3–11 % Lifetime (junior) [72]	German athletes; data on other nationalities or sports modalities as yet unavailable (see Sect. 3.2)
Inferences from athletic performances	–	Popular input for doping-related discussions but impossible to reflect prevalence of doping (see Sects. 4.1, 4.2)
Inferences from ego documents	–	Give some insight into the sociological background of doping and perceived prevalence, but not true prevalence (see Sect. 5)

de Hon, O., et al. (2015). "Prevalence of doping use in elite sports: a review of numbers and methods." Sports Med **45**(1): 57-69.

LIST OF PROHIBITED SUBSTANCES AND METHODS

WADA – http://www.wada-ama.org **SLOADO – http://www.sloado.si**

How does a substance become prohibited?

What are the criteria for adding a substance to the List?

Must meet any 2 of the following 3 criteria:

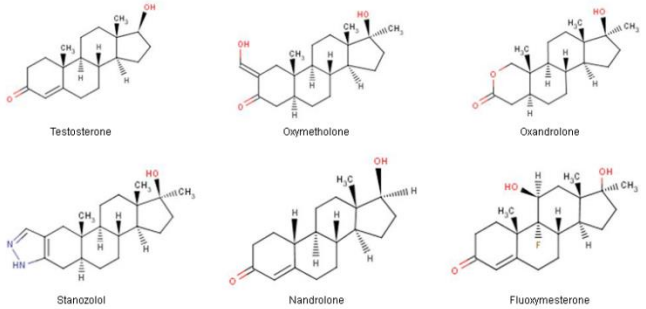
- It has the potential to enhance or enhances sport performance;
- It represents an actual or potential health risk to the athlete;
- It violates the Spirit of Sport.

One example: AAS

Most widely abused doping substances

S1. ANABOLIC AGENTS

Anabolic agents are prohibited.

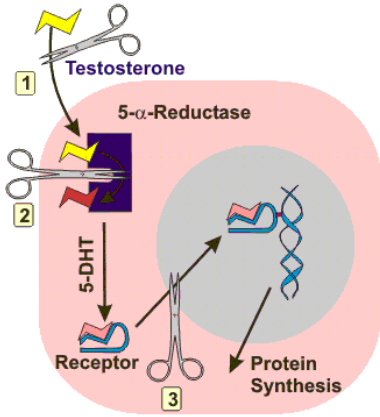


1. Anabolic Androgenic Steroids (AAS)

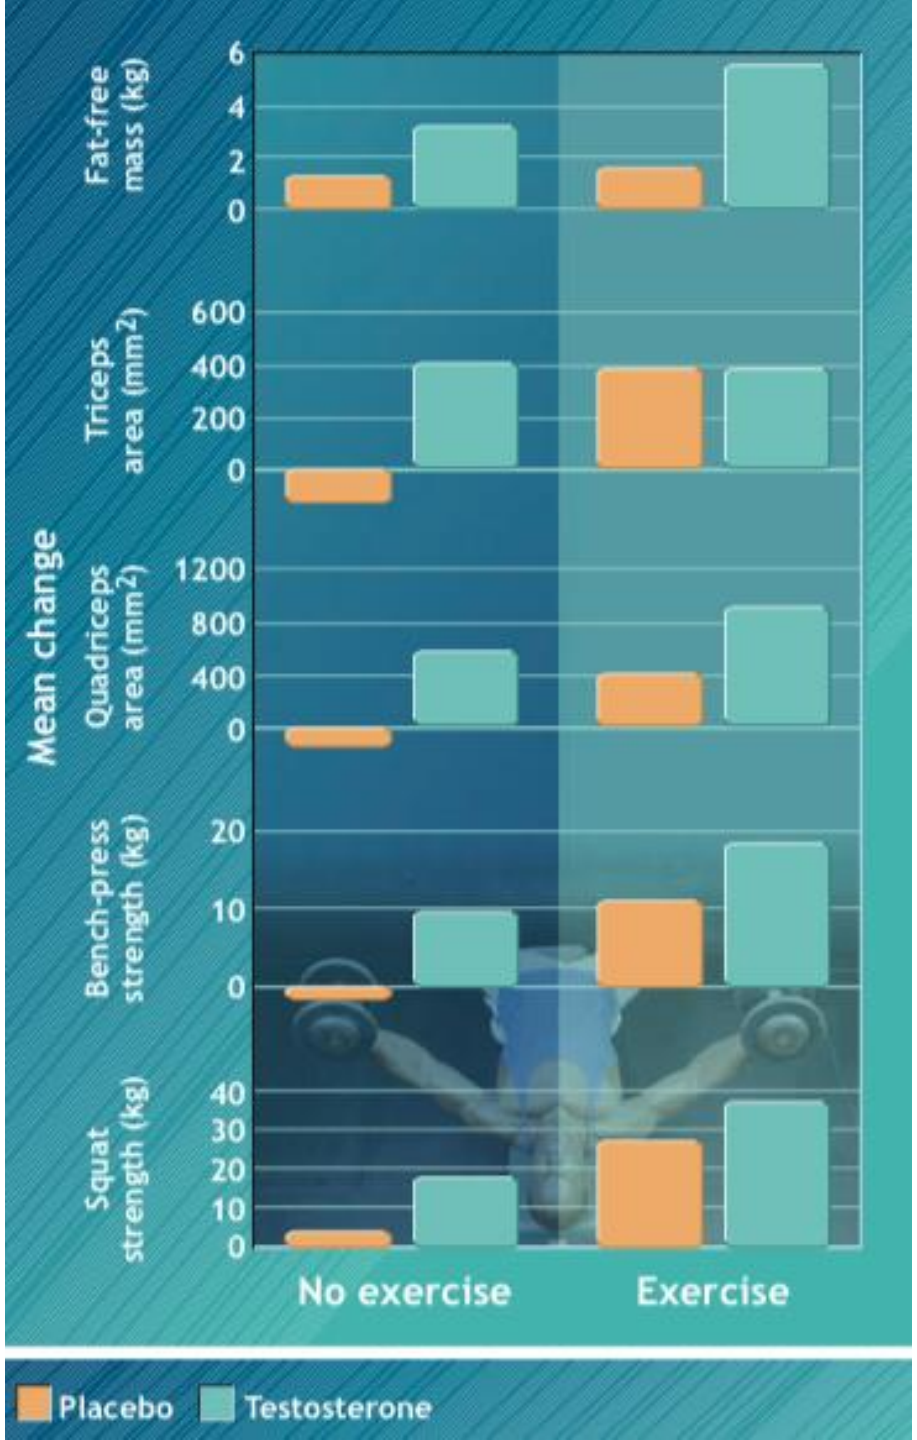
a. **Exogenous*** **AAS**, including:

1-androstenediol (5α-androst-1-ene-3β,17β-diol); **1-androstenedione** (5α-androst-1-ene-3,17-dione); **bolandiol** (estr-4-ene-3β,17β-diol); **bolasterone**; **boldenone**; **boldione** (androsta-1,4-diene-3,17-dione); **calusterone**; **clostebol**; **danazol** ([1,2]oxazolo[4',5':2,3]pregna-4-en-20-yn-17α-ol); **dehydrochlormethyltestosterone** (4-chloro-17β-hydroxy-17α-methylandrosta-1,4-dien-3-one); **desoxymethyltestosterone** (17α-methyl-5α-androst-2-en-17β-ol); **drostanolone**; **ethylestrenol** (19-norpregna-4-en-17α-ol); **fluoxymesterone**; **formebolone**; **furazabol** (17α-methyl [1,2,5]oxadiazolo[3',4':2,3]-5α-androstan-17β-ol); **gestrinone**; **4-hydroxytestosterone** (4,17β-dihydroxyandrost-4-en-3-one); **mestanolone**; **mesterolone**; **metandienone** (17β-hydroxy-17α-methylandrosta-1,4-dien-3-one); **metenolone**; **methandriol**; **methasterone** (17β-hydroxy-2α,17α-dimethyl-5α-androstan-3-one); **methyldienolone** (17β-hydroxy-17α-methylestra-4,9-dien-3-one); **methyl-1-testosterone** (17β-hydroxy-17α-methyl-5α-androst-1-en-3-one); **methylnortestosterone** (17β-hydroxy-17α-methylestr-4-en-3-one); **methyltestosterone**; **metribolone** (methyltrienolone, 17β-hydroxy-17α-methylestra-4,9,11-trien-3-one); **mibolerone**; **nandrolone**; **19-norandrostenedione** (estr-4-ene-3,17-dione); **norboletone**; **norclostebol**; **norethandrolone**; **oxabolone**; **oxandrolone**; **oxymesterone**; **oxymetholone**; **prostanozol** (17β-[(tetrahydropyran-2-yl)oxy]-1'H-pyrazolo[3,4:2,3]-5α-androstane); **quinbolone**; **stanozolol**; **stenbolone**; **1-testosterone** (17β-hydroxy-5α-androst-1-en-3-one); **tetrahydrogestrinone** (17-hydroxy-18a-homo-19-nor-17α-pregna-4,9,11-trien-3-one); **trenbolone** (17β-hydroxyestr-4,9,11-trien-3-one);

and other substances with a similar chemical structure or similar biological effect(s).



- "exogenous" refers to a substance which is not ordinarily produced by the body naturally.
- "endogenous" refers to a substance which is ordinarily produced by the body naturally.



10 weeks of testosterone use (Bhasin S, et al. N Engl J Med 1996; 335:1)

GYNECOMASTIA

HIRSUTISM

Long-term Adverse Effects:

Cardiovascular toxicity:

- left ventricular hypertrophy, diastolic heart failure,
- arhythmias,
- hypertension,
- endotelial dysfunction, atherogenic lipid blood profile, increased development of atherosclerosis
- **higher risk of acute myocardial infarction and acute heart failure (acute heart arrest)**

Long-term Adverse Effects:

Higher incidence of cancer:

- primary liver neoplasms
- renal carcinoma
- testicular cancer
- prostate cancer.

RISK OF DEATH is for AAS users 4.6 x higher in comparison to the control group.

Gateway to doping? Supplement use in the context of preferred competitive situations, doping attitude, beliefs, and norms

S. H. Backhouse[1], L. Whitaker[1], A. Petróczi[2,3]

[1]Carnegie Research Institute, Leeds Metropolitan University, Leeds, United Kingdom, [2]Faculty of Life Sciences, Kingston University, Kingston, UK, [3]Sheffield University, Sheffield, UK
Corresponding author: Susan H. Backhouse, PhD, Carnegie Research Institute, Leeds Metropolitan University, Headingley Campus, Leeds, LS6 3QS, UK. Tel: +44 (0)113 812 4684, E-mail: s.backhouse@leedsmet.ac.uk

Accepted for publication 20 June 2011

Nutritional supplement (NS) use is widespread in sport. This study applied an integrated social cognitive approach to examine doping attitudes, beliefs, and self-reported doping use behavior across NS users ($n = 96$) and nonusers ($n = 116$). Following ethical approval, 212 competitive athletes (age mean = 21.4, s = 4.5; 137 males) completed self-reported measures of doping-related social cognitions and behaviors, presented in an online format where completion implied consent. Significantly more NS users (22.9%) reported doping compared with nonusers (6.0%; $U = 4628.0$, $P < 0.05$). NS users presented significantly more positive attitudes toward doping ($U = 3152.0$, $P < 0.05$) and expressed a significantly greater belief that doping is effective ($U = 3152.0$, $P < 0.05$). When presented with the scenario that performance-enhancing substances are effective and increase the possibility of winning, NS users were significantly more in favor of competing in situations that allow doping ($U = 3504.5$, $P < 0.05$). In sum, doping use is three-and-a-half times more prevalent in NS users compared with nonusers. This finding is accompanied by significant differences in doping attitudes, norms, and beliefs. Thus, this article offers support for the gateway hypothesis; athletes who engage in legal performance enhancement practices appear to embody an "at-risk" group for transition toward doping. Education should be appropriately targeted.

MULTI-SUPPLEMENT USERS ?

Table 2: Prevalence of multiple supplements use in the full sample (n = 874) and among supplement users (n = 520)

Number of supplements reported	% of all athletes	% of all supplement users
None	40.2	
1 supplement	10.4	17.4
2 supplements	14.2	23.7
3 supplements	12.9	21.6
4 supplements	9.8	16.4
5 supplements	5.6	9.4
6 supplements	3.2	5.4
7 supplements	1.8	3.1
8 supplements	1.0	1.7
9 supplements	0.8	1.3

around 60% of athletes are using NS

Somerville SJ, Lewis M, Kuipers H. Accidental breaches of the doping regulations in sport: is there a need to improve the education of sportspeople? Br J Sports Med. 2005Aug.;39(8):512–516.

RISK FOR INADVERTENT DOPING

- strict-liability of the athlets in accordance with WADA (World Anti-Doping Agency) code:

"athletes remain responsible for substances detected in their biofluids, irrespective of their origin"

REGULATIVE CHALLENGES

- A **dietary supplement** **is not reviewed pre-market** and does not have to be proven safe in order to be sold on the shelves of a store.”

- In USA: in 2004 – 2012 FDA removed 237 nutritional supplements from the market

Nutritional supplement can come to the market without being tested for SAFETY or EFFICACY.

Recall -- Firm Press Release

FDA posts press releases and other notices of recalls and market withdrawals from the firms involved as a service to consumers, the media, and other interested parties. FDA does not endorse either the product or the company.

SmartLipo365 Issues Voluntary Nationwide Recall of Smart Lipo Due to Undeclared Sibutramine, Desmethylsibutramine, and Phenolphthalein

Contact:
Consumer:
1-(800)-547-6365

FOR IMMEDIATE RELEASE — June 3, 2015 — Dallas, TX, SmartLipo365 is voluntarily recalling 122 lots of Smart Lipo (800, 900, 950 mg) capsules, to the consumer level. FDA received samples of 800 and 900mg capsules of Smart Lipo and the lab

Problems of contaminated NS

1. producers **don‘t specify ingredients properly**

2. **cross-contamination** with prohibited substances (company working with other substances using same equipment)

3. **Intentional addition of pharmacologically-effective substances** to get better results

Table 1. Nutritional supplements cross-contaminated with anabolic-androgenic steroids (prohormones) in different countries in 2001/2002[23,24]

Country	No. of analyzed products	No. of cross-contaminated products	Percentage of cross-contaminated products
Netherlands	31	8	25.8
Austria	22	5	22.7
UK	37	7	18.9
USA	240	45	18.8
Italy	35	5	14.3
Spain	29	4	13.8
Germany	129	15	11.6
Belgium	30	2	6.7
France	30	2	6.7
Norway	30	1	3.3
Switzerland	13	–	–
Sweden	6	–	–
Hungary	2	–	–

WHICH PROHIBITED SUBSTANCES?

- stimulants
- precursors of anabolic steroid hormones
- anabolic-androgenic steroids
- β2-agonists

Case study: NS product CREATINE

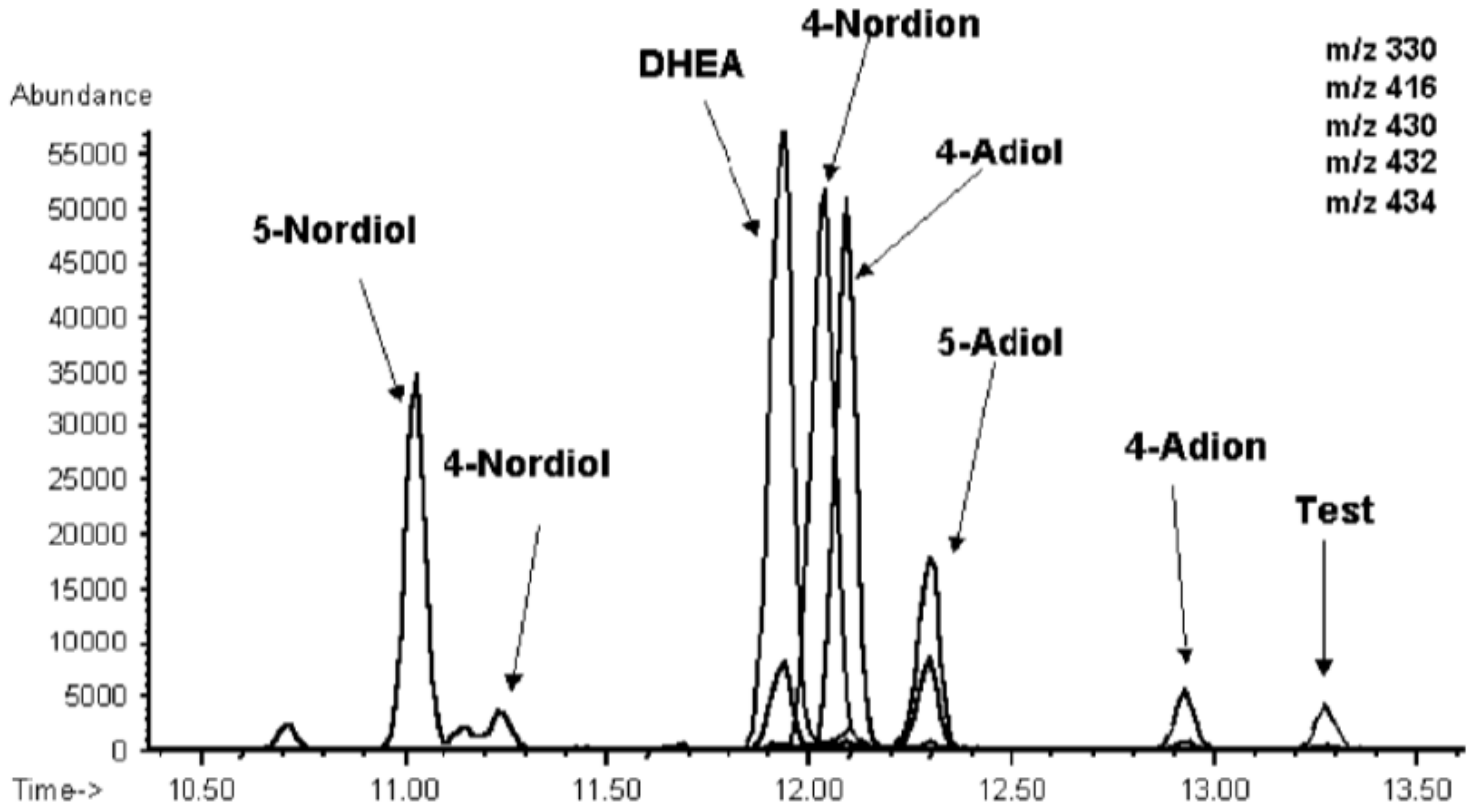

Figure 2. SIM-chromatograms of a creatine product with seven prohormones and testosterone not declared on the label (all steroids are pertrimethylsilylated)[22] 5-nordiol: 19-nor-5-androstene-3β,17β-diol, 4-nordiol: 19-nor-4-androstene-3β,17β-diol, DHEA: dehydroepiandrosterone, 4-nordion: 19-nor-4-androstene-3,17-dione, 4-adiol: 4-androstene-3β,17β-diol, 5-adiol: 5-androstene-3β,17β-diol, 4-adion: 4-androstene-3,17-dione, test: testosterone.

Updated August 17, 2012 - Not a Complete List

Products that have been tested and shown to contain prohibited substances.

Brand Name	Company	What the label says:	Prohibited List Classification	Test Results show:
11-OXO (Lot EL40)	ErgoPharm		S1. Anabolic Agents	Contains 4-androstendione and turinabol
3 Test OXO (Lot # PB0079712)	Complete Nutrition	Label lists a variety of herbals including tribulus terrestris, maca extract, saw palmetto berry, and others.	S1. Anabolic Agents and S6. Stimulants	Contains dehydroepiandrosterone, progesterone, cathine, epehdrine, methylhexaneamine, octopamine, psuedoephedrine
Andro-XS (Lot not specified)	Sports One Nutrition	4-chloro-17α-methyl-andro-4-ene-3β,17β-diol	S1. Anabolic Agents	Contains turinabol
Craze (Lot 1202487)	Driven Sports	N,N-Dimethyl-B-Phenylethylamine	S6. Stimulants	Contains amphetamine; N-methylphenethylamine, beta-methylphenethylamine, ethylamphetamine
Decabolen (Lot 0906162)	CTD Labs	4-chloro-17α-methyl-andro-4-ene-3β,17β-diol ; 2α17α-dimethyl-5 α-androstan-3-one	S1. Anabolic Agents	Contains 4-chloro-17α-methyl-andro-4-ene-3β,17β-diol was not detected in the product but methasterone (2α17α-dimethyl-5 α-androstan-3-one) and its isomer
DR1 (Lot# PB0079412)	Complete Nutrition		S1. Anabolic Agents and S6. Stimulants	Contains 4-Androsten-3,6,17-trione, formestane, 4-Androstenedione, drostanolone, 4-Androsten-3ß,17a-diol, 4-Androsten-3a,17ß-diol, cathine, ephedrine, methylephedrine, N-methylphenethylamine, psuedoephedrine.
Dual Action Grow Tabs (Lot CW-68)	IDS		S1. Anabolic Agents	Contains 1- androstenedione, 4-androstenedione, methandione, turinabol.
E-911 (Lot #9164)	LG Sciences		S6. Stimulants	contains methylsynephrine, octopamine

Cologne List

The Cologne List supports the assessment of a certain nutritional supplement by athletes, coaches and sport medicine specialists. The Cologne List and respectively the Olympic Centre Rhineland do not take on any responsibility using a product published on the Cologne List. The ultimate responsibility remains with each athlete.

Please note:
Neither the fact that a product is published on the Cologne List nor a negative laboratory analysis is a warranty that the product does not contain any prohormones, anabolic substances, or stimulants. The Cologne List only ascertains that listed products are associated with a minimized risk of doping.

Overview | Formula Comparison | Frequently Asked Questions | Reviews | Supplement Facts

Super-Concentrated Pre-Workout Stimulant

Introducing the 2nd generation NeuroCore™ super-concentrated formula with new powerful ingredients and a new and improved great taste. Engineered to redefine extreme energy, intense focus, enhanced muscle strength and powerful muscle pumps, NeuroCore helps you shatter your limits and push past your plateaus. It's packed with precise doses of scientifically studied, fully disclosed key ingredients, including a newly added energy and focus complex to bring an added edge to any hardcore training session.

Compare us to the competition **right now**.

Neurocore MuscleTech Geranium Extract (Geranium robertianum, aerial parts)
Methylhexaneamine, **S6. Stimulants**

MUSCLE

NeuroCore contains 3200mg of beta-alanine – the exact dose scientifically shown to help enhance the muscle- and strength-building process.

STRENGTH

A highly potent and unique creatine known as creatine HCl has been infused into the formula. Creatine is clinically validated to amplify gains in size and strength.

PUMP

NeuroCore™ is formulated with a research-tested dose of pure L-citrulline instead of L-arginine or L-arginine AKG for intense, long-lasting muscle pumps. L-citrulline has actually been shown in research on nitric oxide metabolism to reach superior peak plasma arginine levels compared to a larger dose of L-arginine.

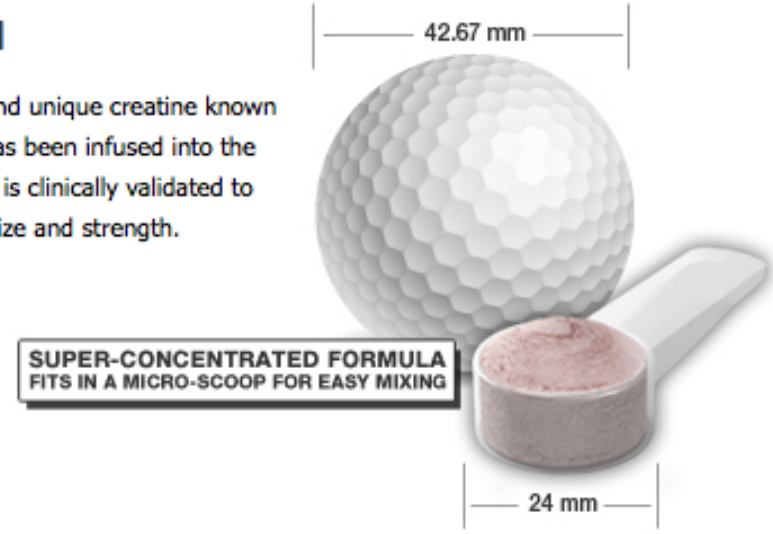

IMAGE NOT ACTUAL SIZE

ENHANCED SENSORY EXPERIENCE

A potent yohimbe bark extract has been added to NeuroCore™. This extract supplies rauwolscine and yohimbine, which are categorized as selective alpha-2 receptor antagonists. Human research indicates that blocking alpha-2 receptors may play a significant role in supporting blood flow.

The Facts Don't Lie

Many pre-workout concentrates do not disclose the ingredient amounts in their formulas, so we tested their formulas and discovered that they're underdosed when it comes to the latest scientific research – and we have the third-party lab tests to back it up.

NeuroCore		Competitor #1	Competitor #2	What You Should Know
Ingredient Amounts Fully Disclosed	**YES**	NO	NO	Unlike the competitors who do not disclose the ingredient amounts in their formulas, NeuroCore is different. The doses of its clinically validated and scientifically tested ingredients are fully disclosed so you know exactly what you are getting.

Acute Myocardial Infarction Associated with Dietary Supplements

Containing 1,3-Dimethylamylamine and *Citrus aurantium*

Triston B. Smith, MD
Brian A. Staub, MD
Gayathri M. Natarajan, MD
David M. Lasorda, DO
Indu G. Poornima, MBBS

We describe the case of a previously healthy 22-year-old man who presented with anginal chest pain and was diagnosed with a non-ST-elevation myocardial infarction. For 3 weeks, he had been ingesting the dietary supplements Jack3d® (principal ingredient, 1,3-dimethylamylamine) and Phenorex™ (principal ingredient, Citrus aurantium*) daily, before undertaking physical activity. Coronary angiograms revealed a proximal left anterior descending coronary artery thrombus with distal embolization. A combined medical regimen led to resolution of the thrombus. Three months later, the patient was asymptomatic with no evidence of ischemia.*

The primary ingredients in the sympathomimetic supplements taken by our patient are controversial in the medical community and have been individually associated with adverse cardiac events. There are no safety data on their simultaneous use. We discuss other reports of adverse effects associated with these supplements and recommend that the relevant safety guidelines be revised. ***(Tex Heart Inst J 2014;41(1):70-2)***
