LEVULINIC ACID HDO: CONCLUSIONS

- **225 °C slow but selective LA HDO**
- **Above 225 °C competitive non-catalytic DCX overdominates catalytic HDO**
- ***Ea* DCX 134 kJ mol^{-1}, dimerization 61 kJ mol^{-1}, HDO 19 kJ mol^{-1}**
- **HDO selectivity ↗ H_2 pressure and catalyst loading**
- **Mass transfer does not play major role, as long as gas hold-up is sufficient (> 800 rpm)**
- **Microkinetic model accounts process parameters well (*T*, *p*, catalyst loading, stirring, geometry)**
