Peter Globokar

Mooreland Partners London

Outline

- ▶ **Big-Data in numbers**
- ▶ **Big-Data Definitions**
- ▶ **Motivation**
- ▶ **State of Market**

- ▶ **Techniques**
- ▶ **Tools**
- ▶ **Data Science**

- ▶ **Applications**
 - Recommendation, Social networks, Media Monitoring

- ▶ **Concluding remarks**

Big-Data in numbers

Big data—a growing torrent

\$600 to buy a disk drive that can store all of the world's music

5 billion mobile phones in use in 2010

30 billion pieces of content shared on Facebook every month

40% projected growth in global data generated per year vs. **5%** growth in global IT spending

235 terabytes data collected by the US Library of Congress by April 2011

15 out of 17 sectors in the United States have more data stored per company than the US Library of Congress

\$5 million vs. \$400

Price of the fastest supercomputer in 1975¹ and an iPhone 4 with equal performance

1 NEW DEFINITION IS ADDED ON **urban**

1,600+ READS ON **Scribd**

13,000+ HOURS **MUSIC** STREAMING ON **PANDORA**

12,000+ NEW ADS POSTED ON **craigslist**

370,000+ MINUTES VOICE CALLS ON **skype**

98,000+ **TWEETS**

20,000+ NEW POSTS ON **tumblr**

13,000+ **iPhone** APPLICATIONS DOWNLOADED

100+ 40+ **Answers.com** **YAHOO! ANSWERS**

QUESTIONS ASKED ON THE INTERNET...

25+ HOURS **TOTAL DURATION**

600+ NEW **VIDEOS**

70+ **DOMAINS** REGISTERED

60+ NEW **BLOGS**

1,500+ **BLOG** POSTS

168 MILLION **EMAILS** ARE SENT

694,445 **SEARCH** QUERIES

1,700+ **Firefox** DOWNLOADS

695,000+ **facebook** STATUS UPDATES

79,364 **WALL** POSTS

510,040 **COMMENTS**

INTERESTING FACTS

More than
56%

of Social Networking Users have used Social Networking Sites for spying on their partners.

Brazilians have the highest online friends averaging **481** friends per user, whereas Japanese have the least average of only **29** friends.

Chinese users spend the maximum time of more than **5 hours a week**, in shopping online.

More than
1 Billion
Search Queries per day on Google.

4 Billion views per day on Video Sharing Website YouTube. Video content of more than **60 hours** gets uploaded every minute onto YouTube.

More than **250 Million** Tweets per day.
More than **800 Million** updates on Facebook per day

Big-Data Definitions

...so, what is Big-Data?

- ▶ ‘Big-data’ is similar to ‘Small-data’, but bigger
- ▶ ...but having data bigger it requires different approaches:
 - techniques, tools, architectures
- ▶ ...with an aim to solve new problems
 - ...or old problems in a better way.

Characterization of Big Data: volume, velocity, variety (V3)

- ▶ **Volume** – challenging to load and process (how to index, retrieve)
- ▶ **Variety** – different data types and degree of structure (how to query semi-structured data)
- ▶ **Velocity** – real-time processing influenced by rate of data arrival

From "Understanding Big Data" by IBM

The extended 3+n Vs of Big Data

- ▶ 1. **Volume** (lots of data = “Tonnabytes”)
- ▶ 2. **Variety** (complexity, curse of dimensionality)
- ▶ 3. **Velocity** (rate of data and information flow)
- ▶ 4. **Veracity** (verifying inference-based models from comprehensive data collections)
- ▶ 5. **Variability**
- ▶ 6. **Venue** (location)
- ▶ 7. **Vocabulary** (semantics)

Motivation for Big-Data

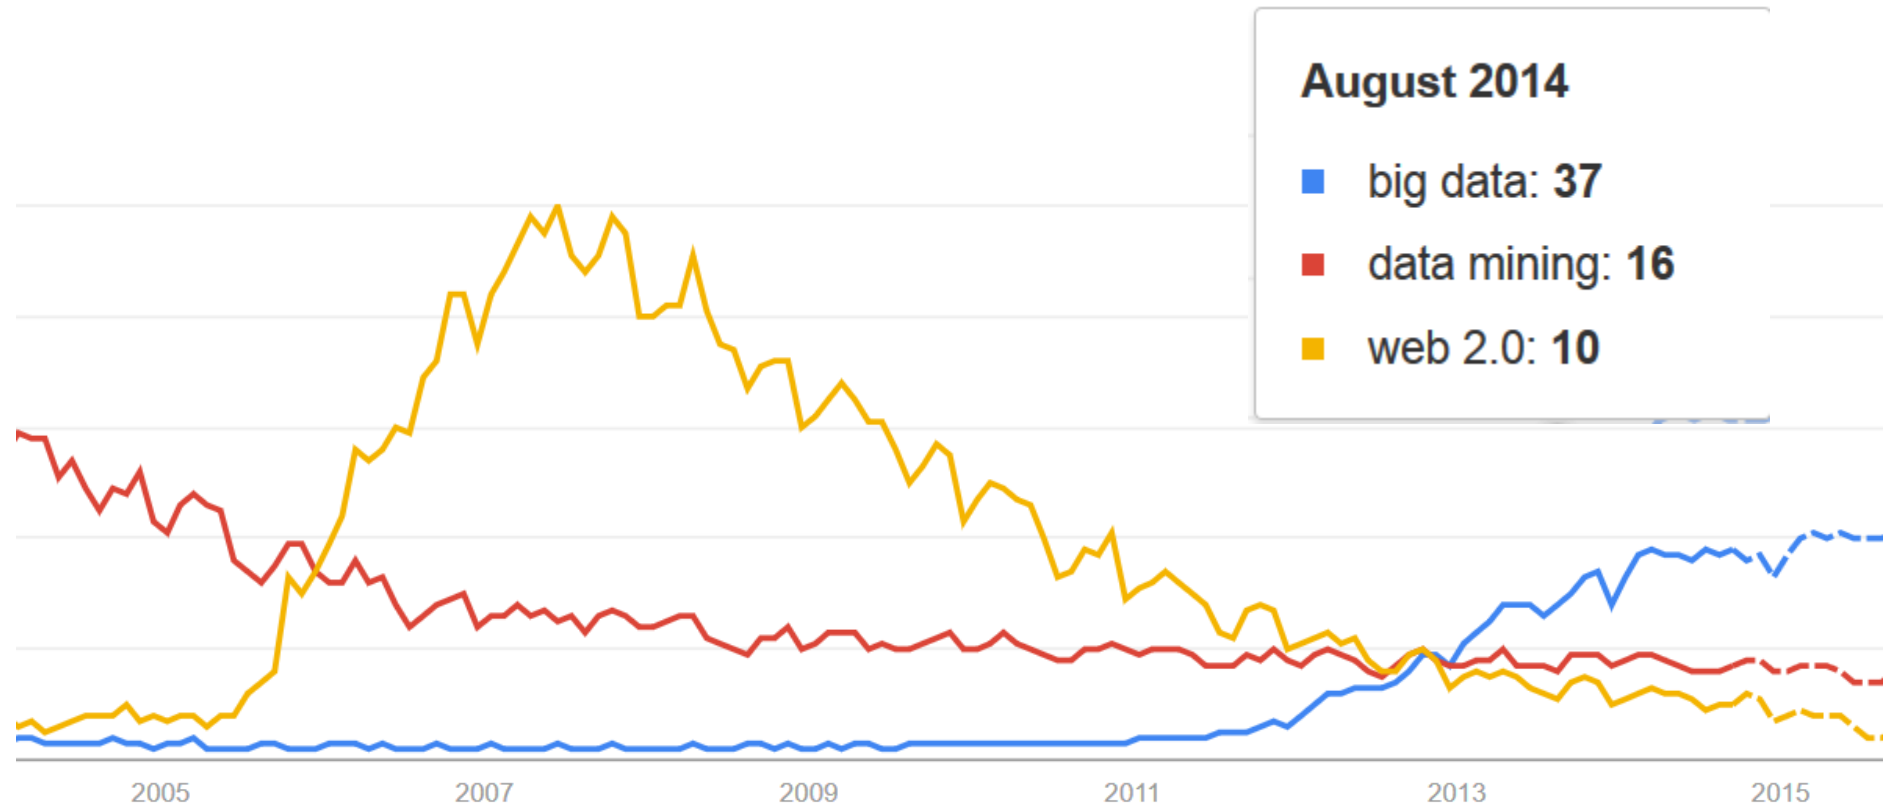

Big-Data popularity on the Web (through the eyes of “Google Trends”)

Comparing volume of “big data” and “data mining” queries

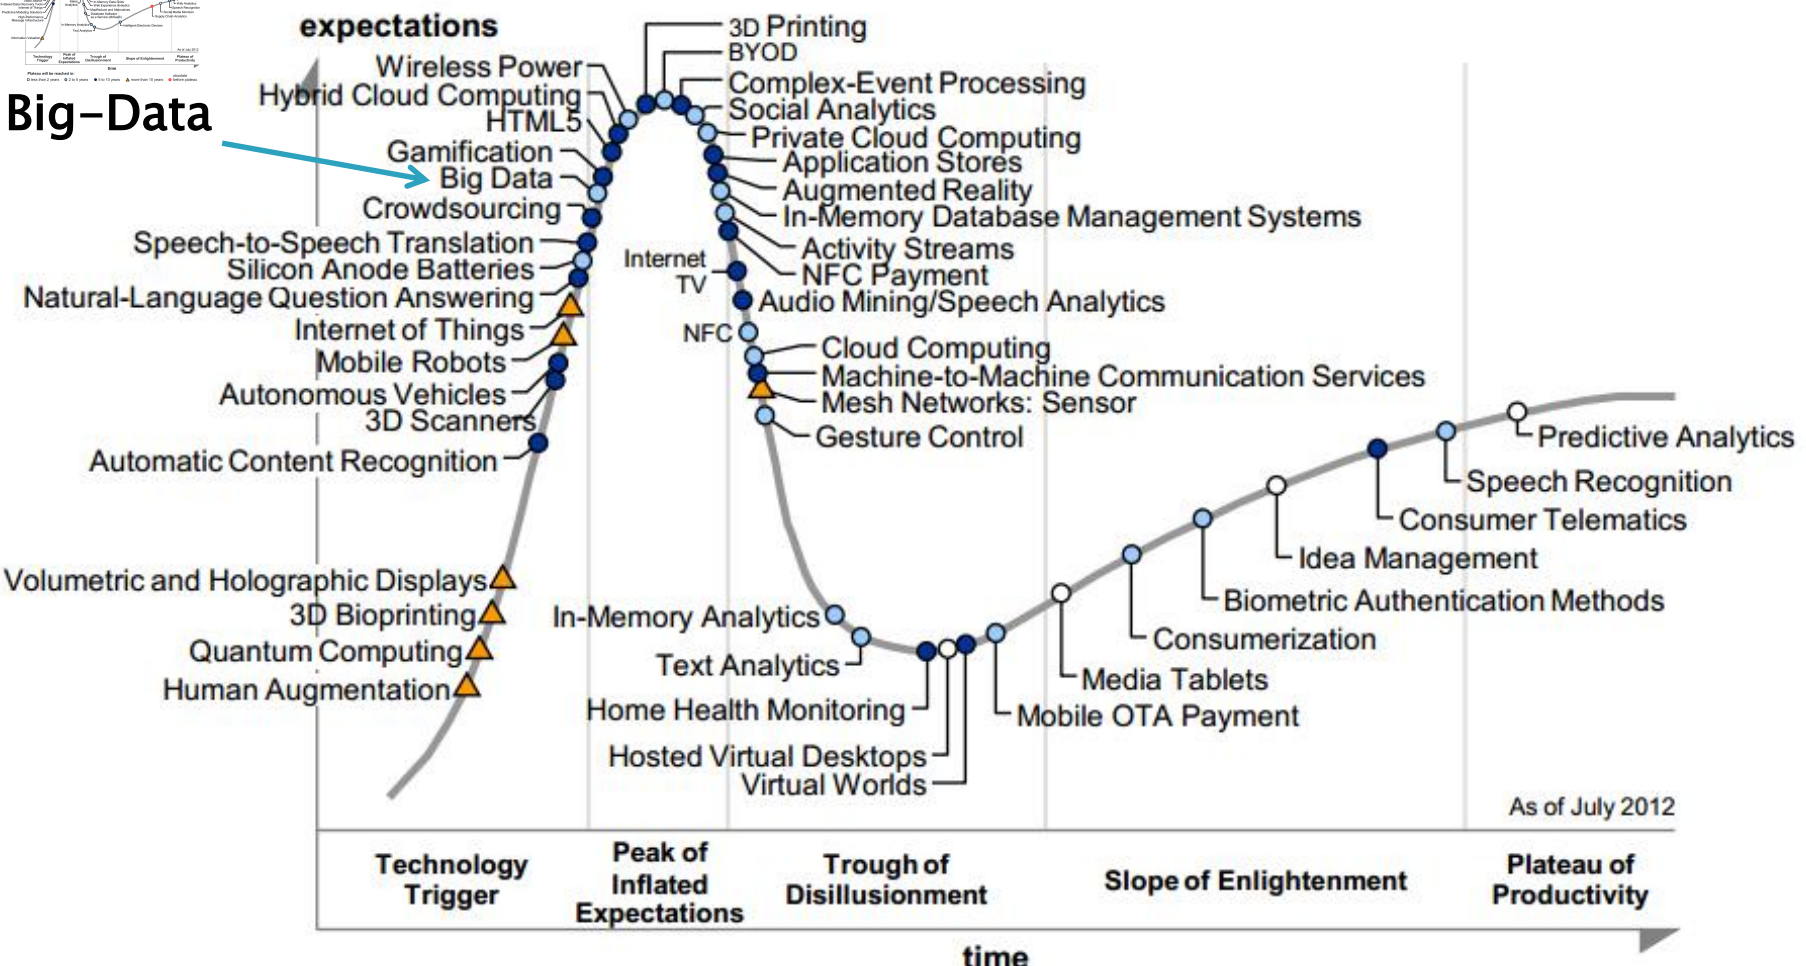

...but what can happen with “hypes”

...adding “web 2.0” to “big data” and “data mining” queries volume

Emerging Technologies Hype Cycle 2012

Big-Data

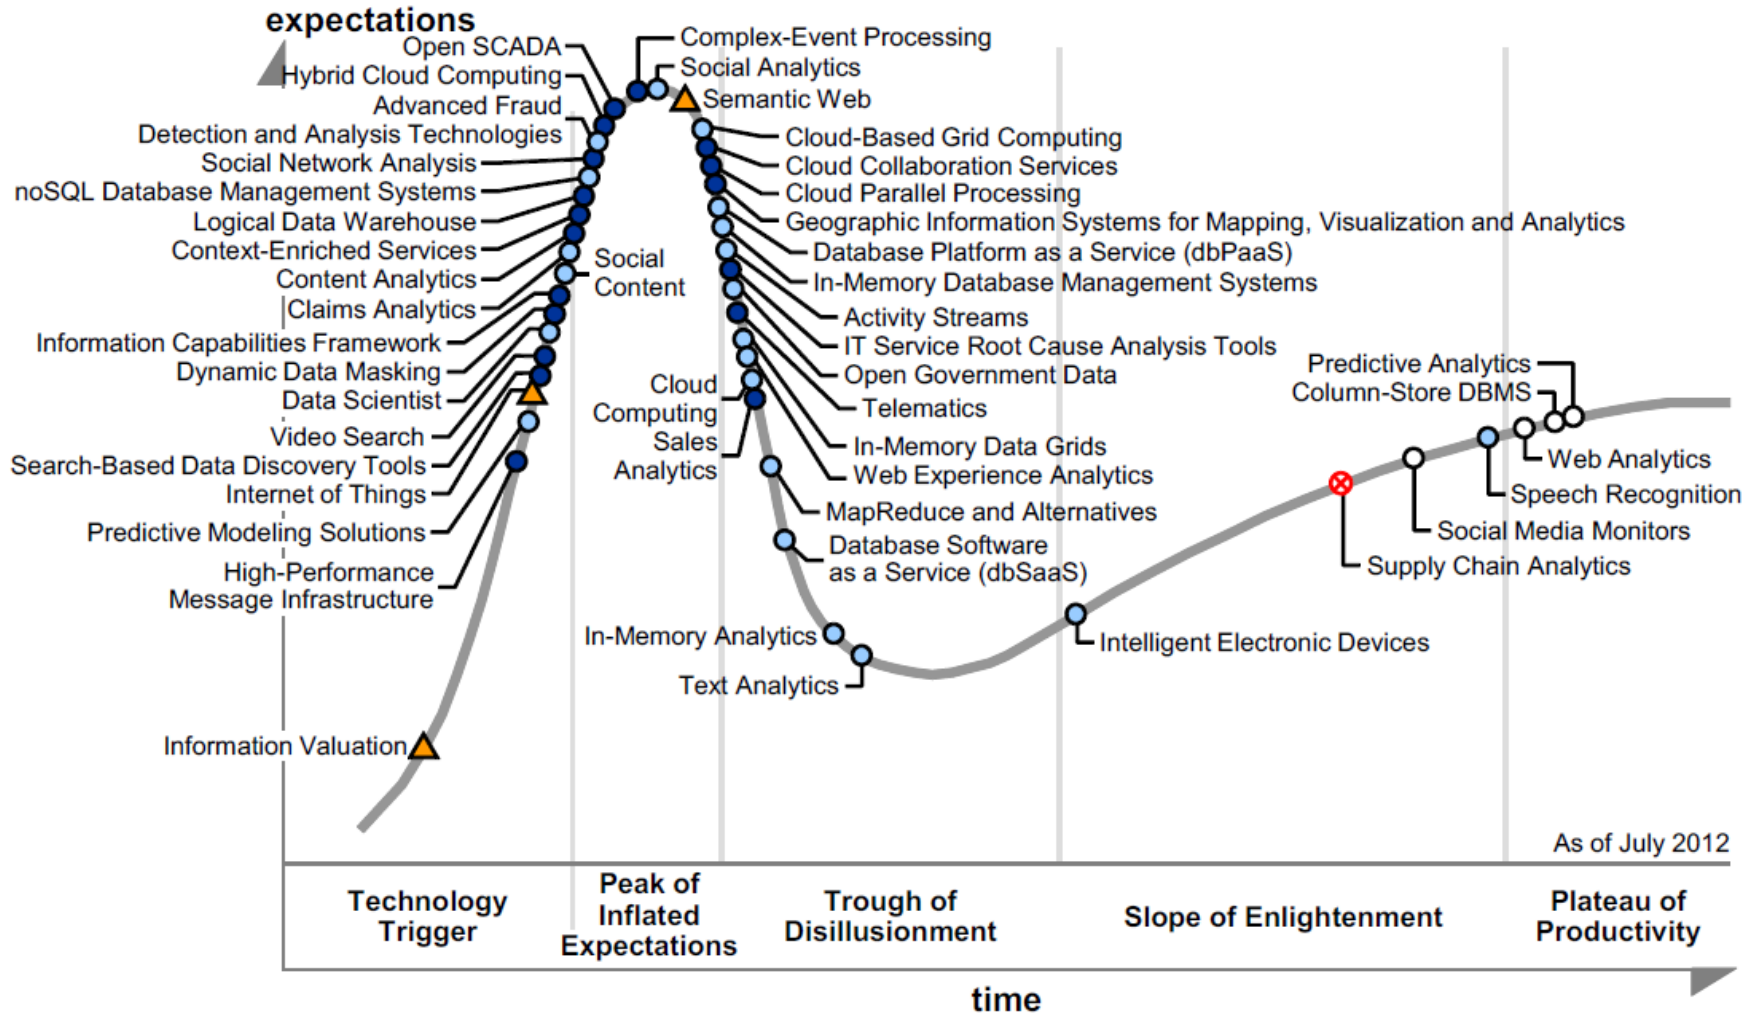

Plateau will be reached in:

- less than 2 years
- 2 to 5 years
- 5 to 10 years
- ▲ more than 10 years
- ⊗ obsolete before plateau

Gartner Hype Cycle for Big Data, 2012

Figure 1. Hype Cycle for Big Data, 2012

Plateau will be reached in:

○ less than 2 years

● 2 to 5 years

● 5 to 10 years

▲ more than 10 years

○ obsolete

⊗ before plateau

Why Big-Data?

- ▶ Key enablers for the appearance and growth of “Big Data” are:
 - Increase of storage capacities
 - Increase of processing power
 - Availability of data

Enabler: Data storage

Data storage has grown significantly, shifting markedly from analog to digital after 2000

Global installed, optimally compressed, storage

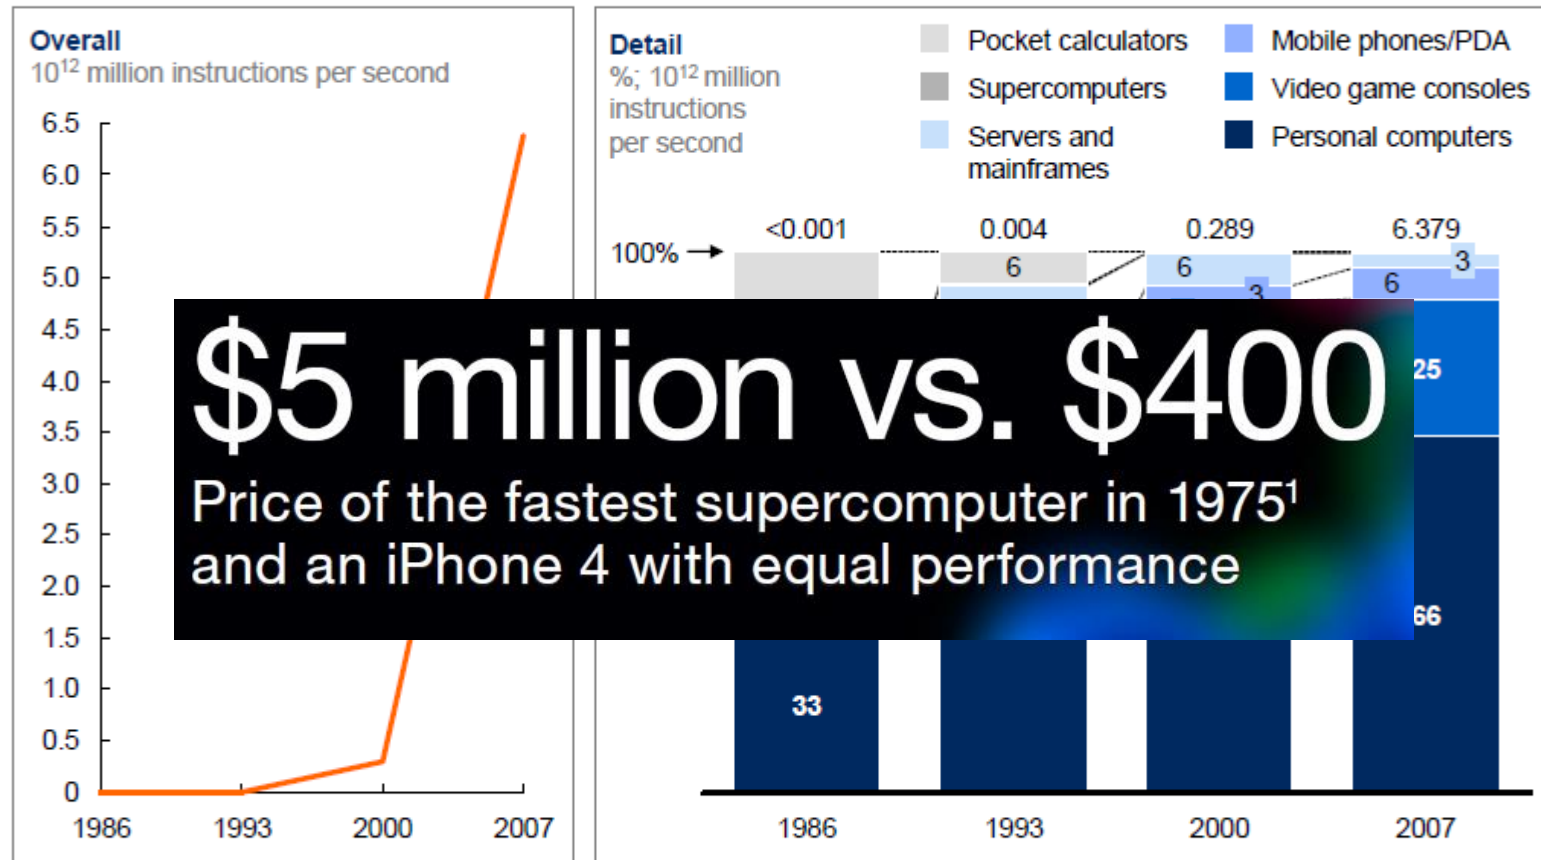

NOTE: Numbers may not sum due to rounding.

SOURCE: Hilbert and López, "The world's technological capacity to store, communicate, and compute information," *Science*, 2011

Enabler: Computation capacity

Computation capacity has also risen sharply

Global installed computation to handle information

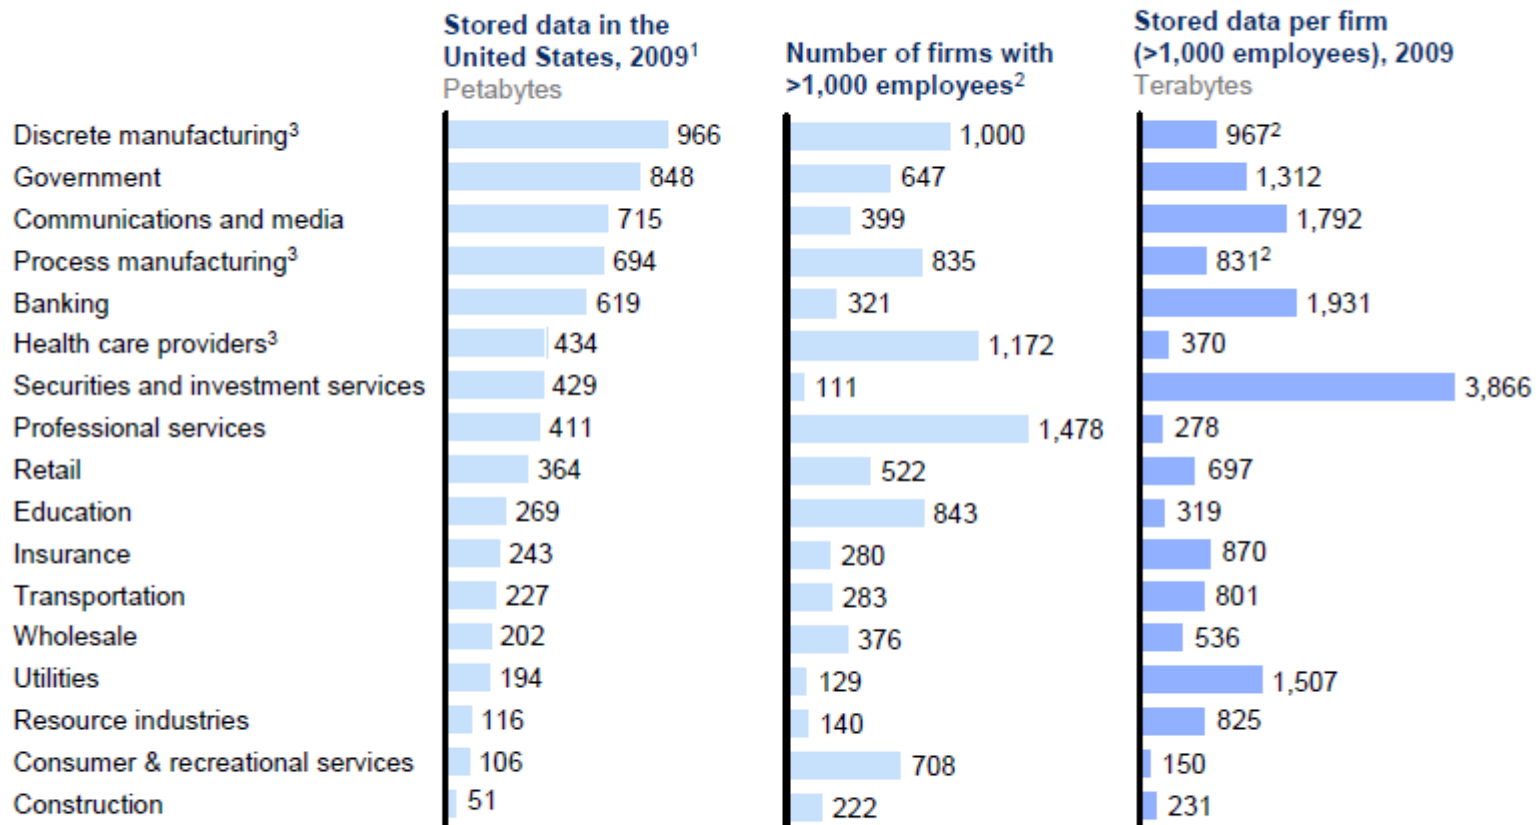

NOTE: Numbers may not sum due to rounding.

SOURCE: Hilbert and López, "The world's technological capacity to store, communicate, and compute information," *Science*, 2011

Enabler: Data availability

Companies in all sectors have at least 100 terabytes of stored data in the United States; many have more than 1 petabyte

1 Storage data by sector derived from IDC.

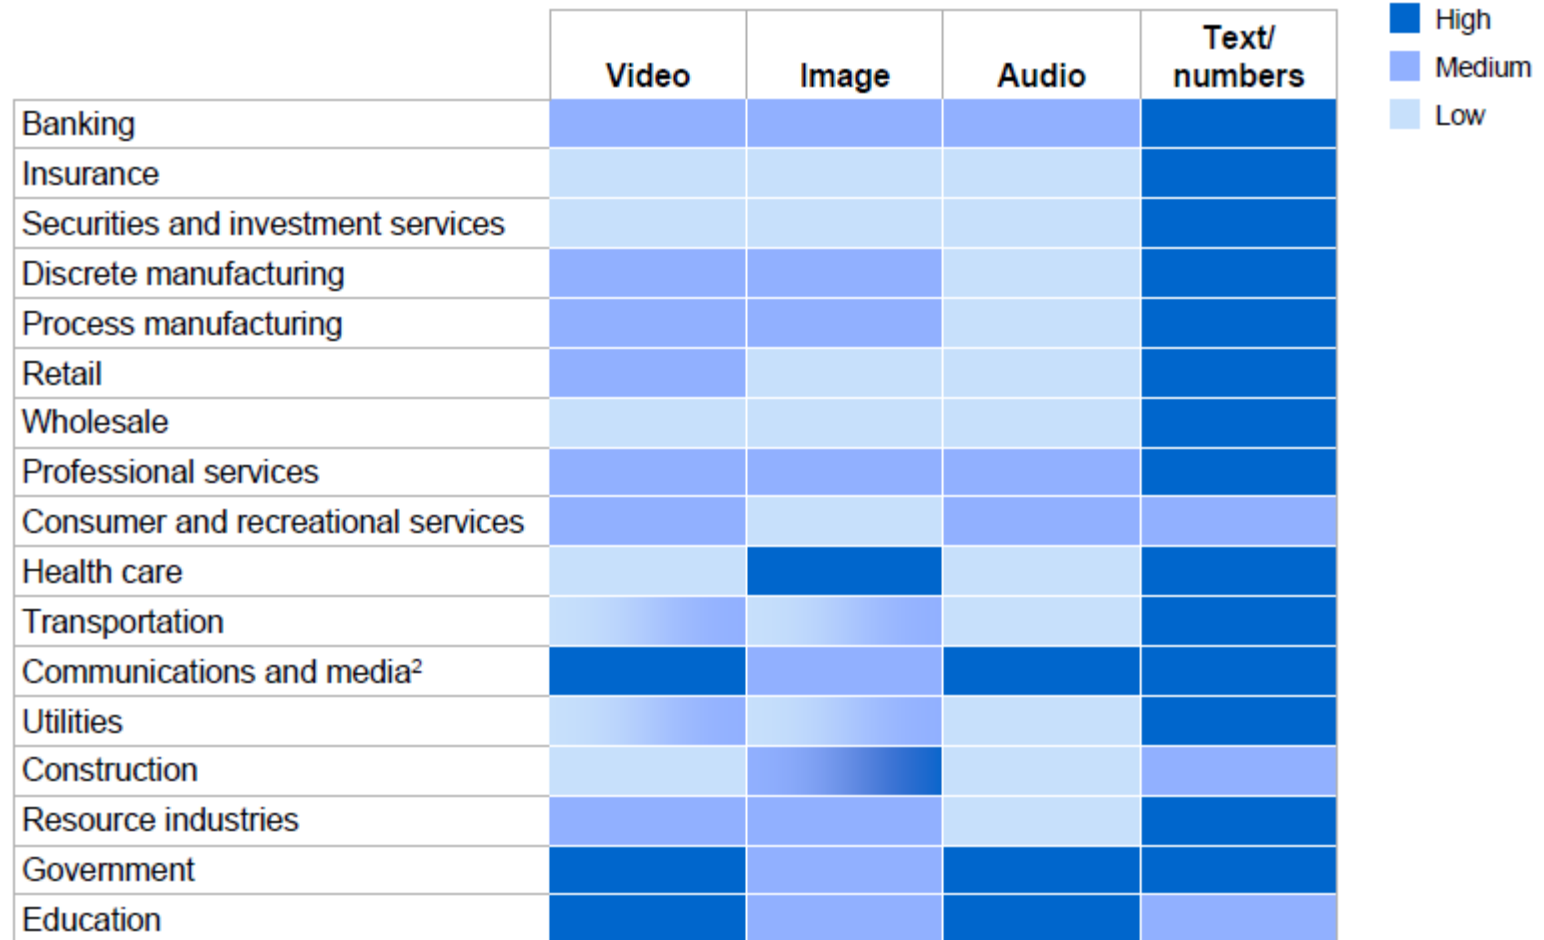

2 Firm data split into sectors, when needed, using employment

3 The particularly large number of firms in manufacturing and health care provider sectors make the available storage per company much smaller.

SOURCE: IDC; US Bureau of Labor Statistics; McKinsey Global Institute analysis

Type of available data

The type of data generated and stored varies by sector¹

¹ We compiled this heat map using units of data (in files or minutes of video) rather than bytes.

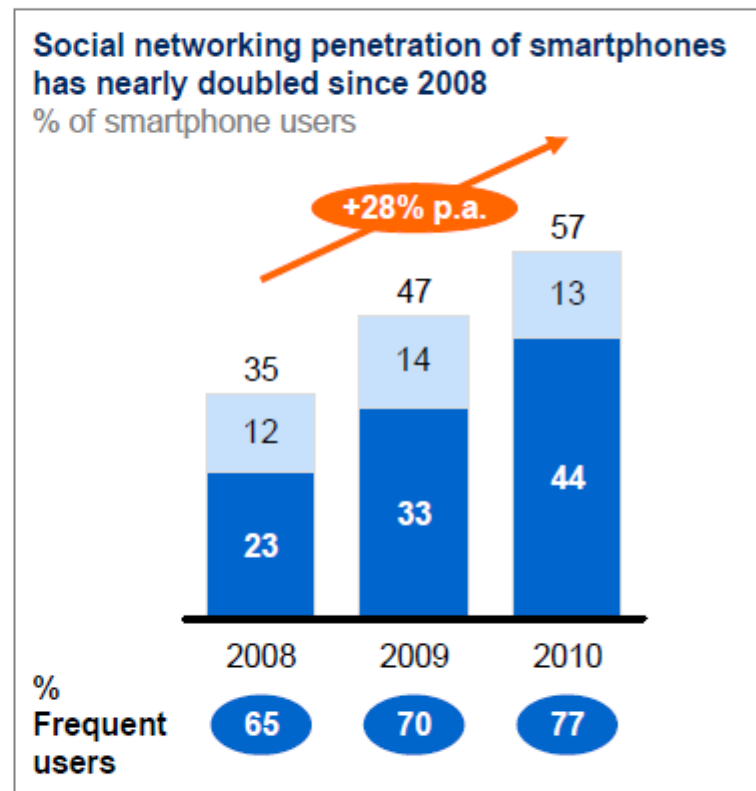

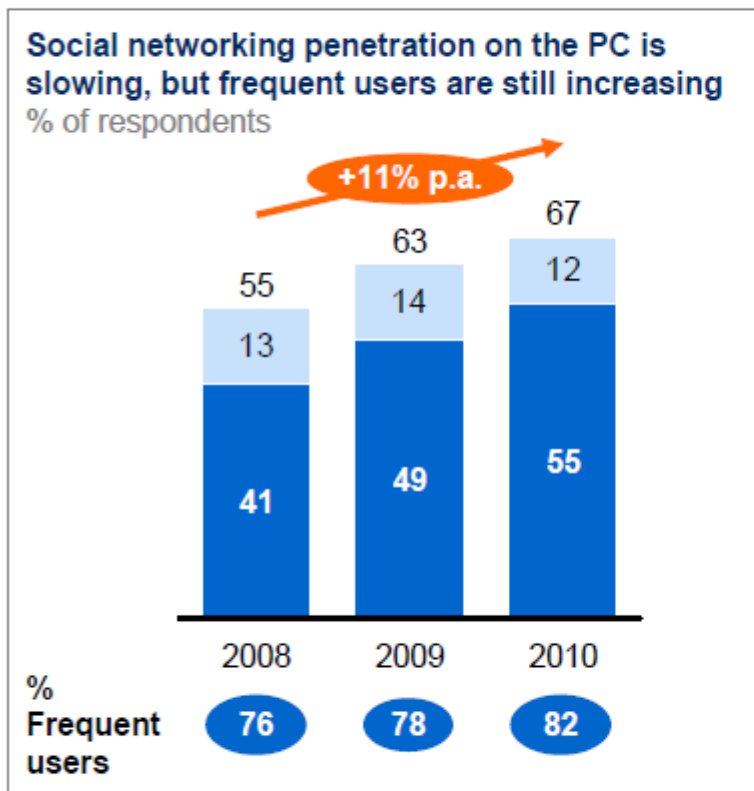

² Video and audio are high in some subsectors.

SOURCE: McKinsey Global Institute analysis

Data available from social networks and mobile devices

The penetration of social networks is increasing online and on smartphones; frequent users are increasing as a share of total users¹

■ Frequent user²

- 1 Based on penetration of users who browse social network sites. For consistency, we exclude Twitter-specific questions (added to survey in 2009) and location-based mobile social networks (e.g., Foursquare, added to survey in 2010).
- 2 Frequent users defined as those that use social networking at least once a week.

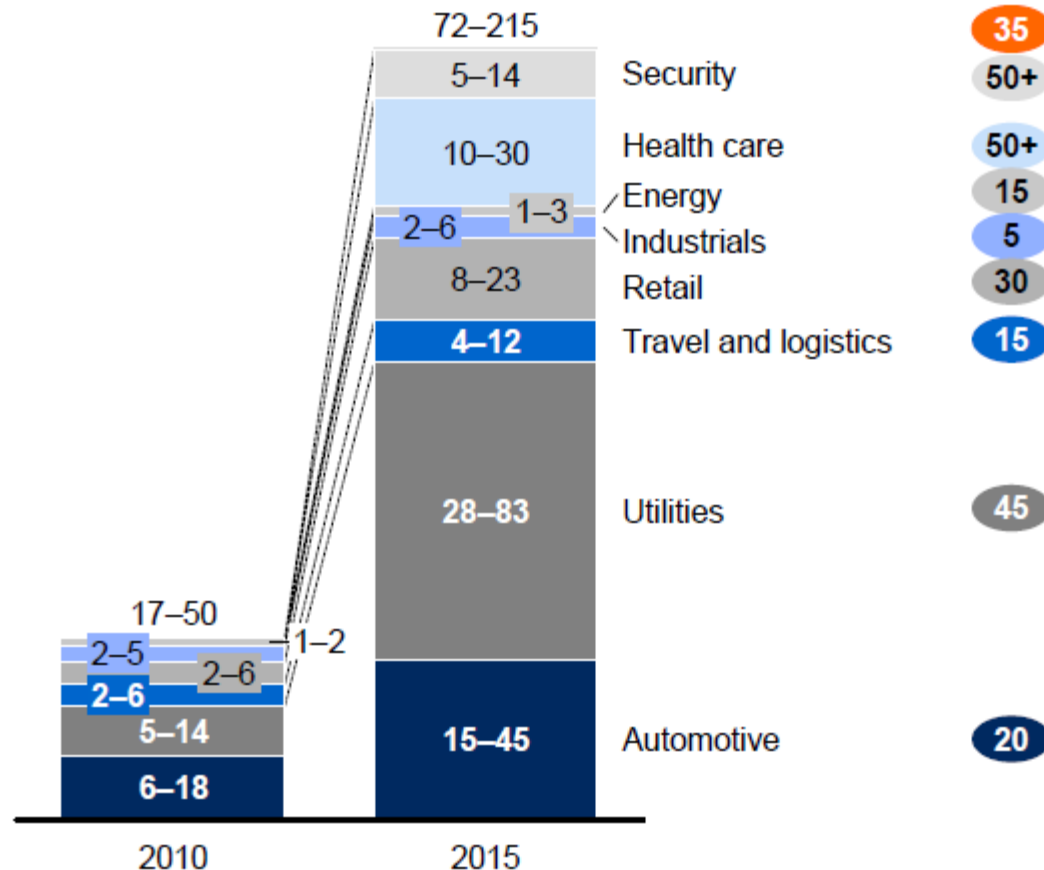

SOURCE: McKinsey iConsumer Survey

Data available from “Internet of Things”

Data generated from the Internet of Things will grow exponentially as the number of connected nodes increases

Estimated number of connected nodes
Million

Compound annual
growth rate 2010–15, %

NOTE: Numbers may not sum due to rounding.

SOURCE: Analyst interviews; McKinsey Global Institute analysis

Birth & Growth of “Internet of Things”

(in \$US millions)

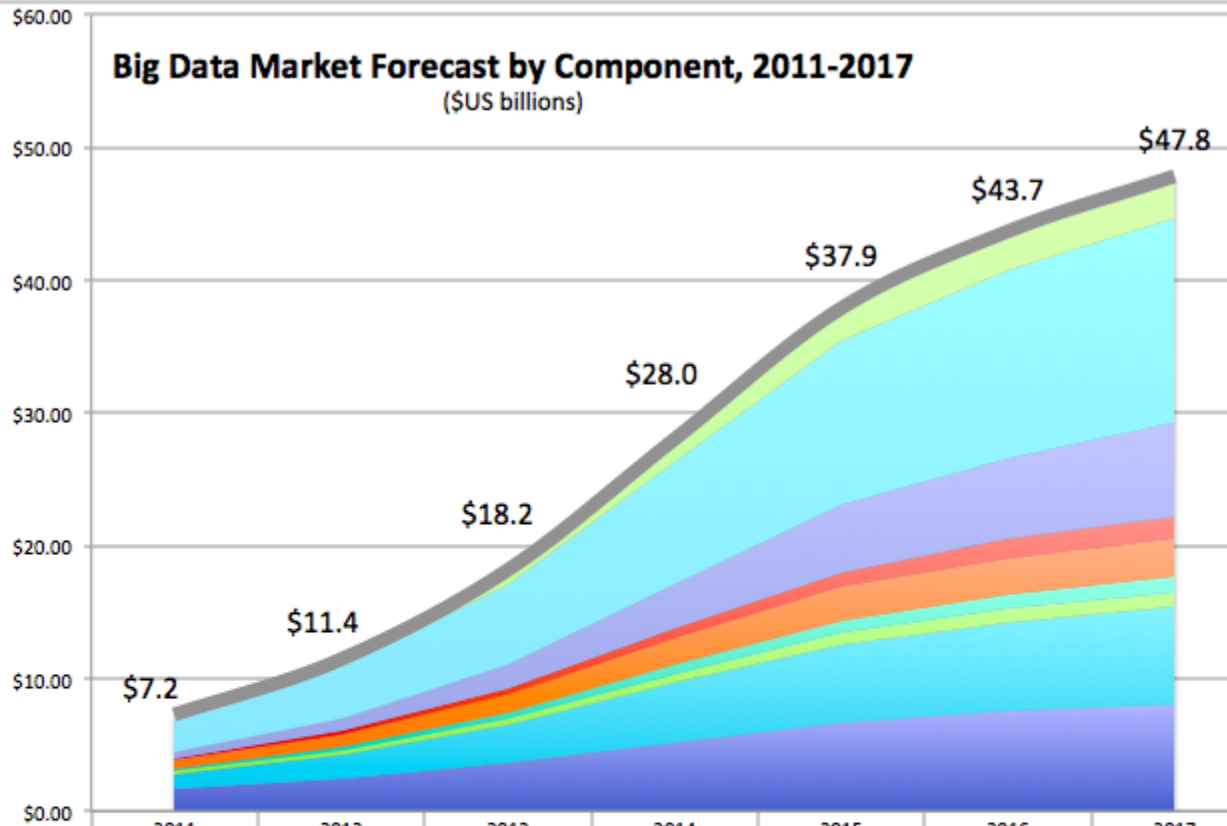

Big Data Market Forecast (2011–2017)

(<http://wikibon.org/w/images/b/bb/Forecast-BDMSVR2012.png>)

Yearly Revenue (\$US billions)

	2011	2012	2013	2014	2015	2016	2017
Big Data XaaS Revenue	\$0.35	\$0.61	\$1.05	\$1.74	\$2.47	\$2.91	\$3.24
Big Data Professional Services Revenue	\$2.45	\$3.87	\$6.10	\$9.29	\$12.37	\$14.14	\$15.38
Big Data Application (Analytic and Transactional) Software	\$0.49	\$0.94	\$1.80	\$3.29	\$5.02	\$6.15	\$7.00
Big Data NoSQL Database Software	\$0.10	\$0.19	\$0.39	\$0.73	\$1.14	\$1.41	\$1.62
Big Data SQL Database Software	\$0.72	\$1.02	\$1.45	\$1.99	\$2.47	\$2.73	\$2.90
Big Data Infrastructure Software	\$0.16	\$0.26	\$0.43	\$0.70	\$0.96	\$1.12	\$1.24
Big Data Networking Revenue	\$0.18	\$0.28	\$0.44	\$0.67	\$0.89	\$1.02	\$1.11
Big Data Storage Revenue	\$1.16	\$1.83	\$2.89	\$4.40	\$5.86	\$6.70	\$7.28
Big Data Compute Revenue	\$1.64	\$2.45	\$3.64	\$5.23	\$6.70	\$7.50	\$8.06
Total Big Data Revenue	\$7.2	\$11.4	\$18.2	\$28.0	\$37.9	\$43.7	\$47.8

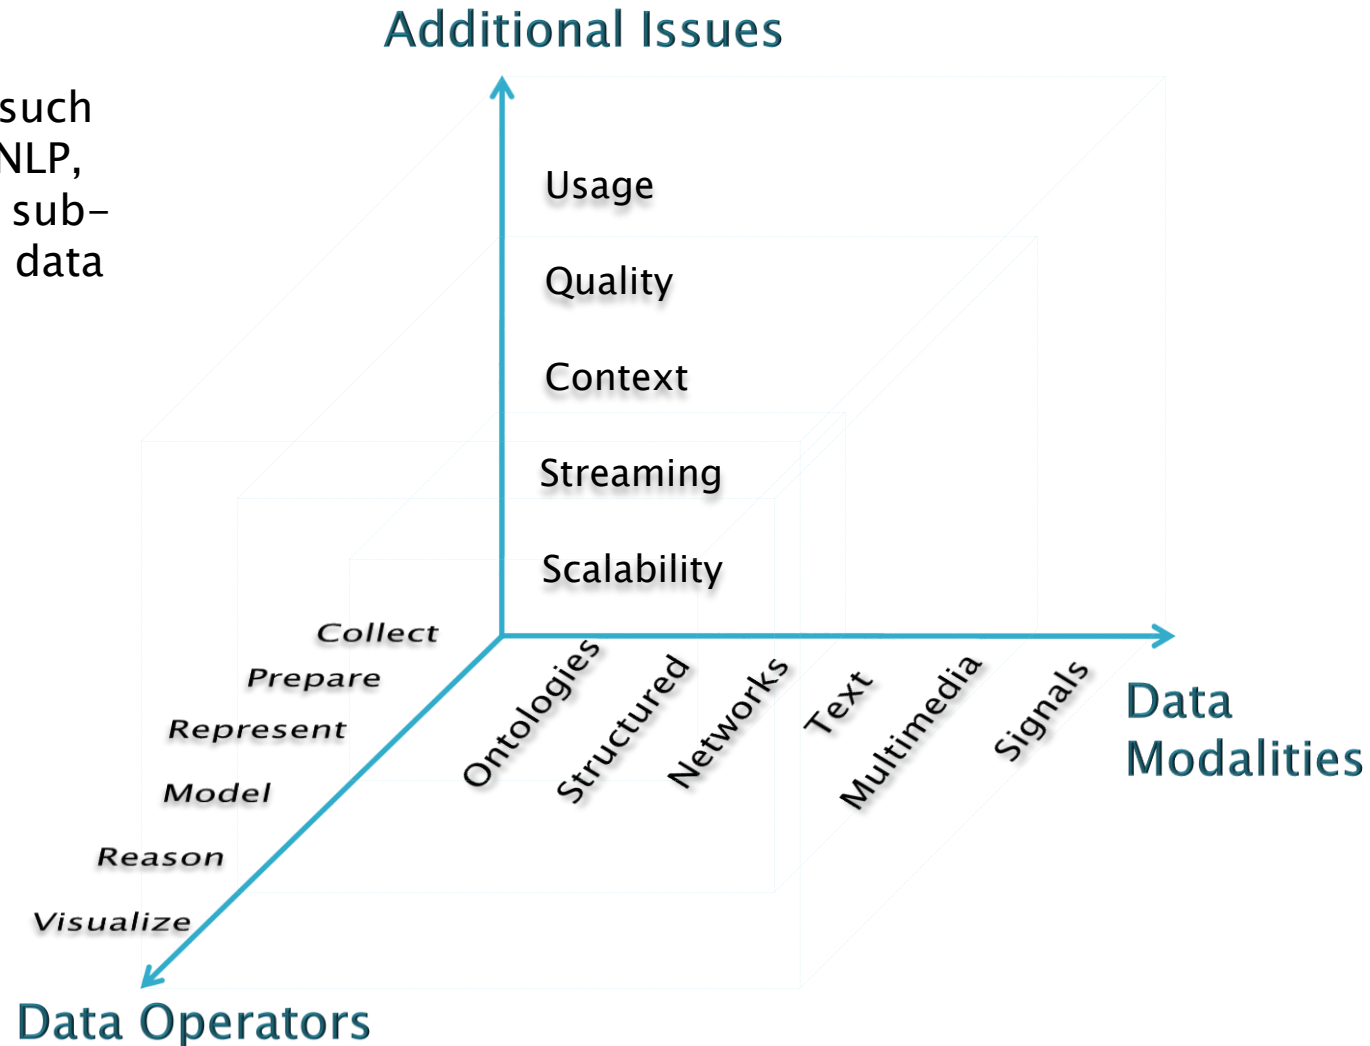

Techniques

When Big-Data is really a hard problem?

- ▶ ...when the operations on data are complex:
 - ...e.g. simple counting is not a complex problem
 - Modeling and reasoning with data of different kinds can get extremely complex
- ▶ Good news about big-data:
 - Often, because of vast amount of data, modeling techniques can get simpler (e.g. smart counting can replace complex model-based analytics)...
 - ...as long as we deal with the scale

What matters when dealing with data?

- ▶ Research areas (such as IR, KDD, ML, NLP, SemWeb, ...) are sub-cubes within the data cube

Meaningfulness of Analytic Answers (1 / 2)

- ▶ A risk with “Big-Data mining” is that an analyst can “discover” patterns that are meaningless
- ▶ Statisticians call it **Bonferroni’s principle**:
 - Roughly, if you look in more places for interesting patterns than your amount of data will support, you are bound to find crap

Meaningfulness of Analytic Answers (2/2)

Example:

- ▶ We want to find (unrelated) people who **at least twice have stayed at the same hotel on the same day**
 - 10^9 people being tracked.
 - 1000 days.
 - Each person stays in a hotel 1% of the time (1 day out of 100)
 - Hotels hold 100 people (so 10^5 hotels).
 - If everyone behaves randomly (i.e., no terrorists) will the data mining detect anything suspicious?
- ▶ Expected number of “suspicious” pairs of people:
 - 250,000
 - ... too many combinations to check – we need to have some additional evidence to find “suspicious” pairs of people in some more efficient way

What are specific operators used in Big-Data applications

- ▶ **Smart sampling of data**
 - ...reducing the original data while not losing the statistical properties of data
- ▶ **Finding similar items**
 - ...efficient multidimensional indexing
- ▶ **Incremental updating of the models**
 - (vs. building models from scratch)
 - ...crucial for streaming data
- ▶ **Distributed linear algebra**
 - ...dealing with large sparse matrices

Analytical operators on Big-Data

- ▶ On the top of the previous ops we perform usual data mining/machine learning/statistics operators:
 - **Supervised** learning (classification, regression, ...)
 - **Non-supervised** learning (clustering, different types of decompositions, ...)
 - ...
- ▶ ...we are just more careful which algorithms we choose
 - typically linear or sub-linear versions of the algorithms

...guide to Big-Data algorithms

- ▶ An excellent overview of the algorithms covering the above issues is the book “Rajaraman, Leskovec, Ullman: Mining of Massive Datasets”

- ▶ Downloadable from:

<http://infolab.stanford.edu/~ullman/mmds.html>

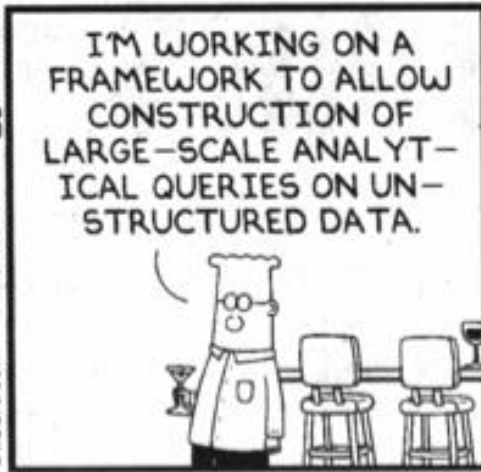

Tools

DILBERT

Dilbert.com DilbertCartoonist@gmail.com

© 2012 Scott Adams, Inc./Dist. by Universal Uclick

Types of tools typically used in Big-Data scenarios

- ▶ Where processing is **hosted**?
 - Distributed Servers / Cloud (e.g. Amazon EC2)
- ▶ Where data is **stored**?
 - Distributed Storage (e.g. Amazon S3)
- ▶ What is the **programming model**?
 - Distributed Processing (e.g. MapReduce)
- ▶ How data is **stored & indexed**?
 - High-performance schema-free databases (e.g. MongoDB)
- ▶ What operations are performed on data?
 - Analytic / Semantic Processing

Plethora of "Big Data" related tools

Data Analysis & Platforms

Databases / Data warehousing

Operational

Multivalued database

Big Data search

Data aggregation

Business Intelligence

Data Mining

Social

Graphs

Multidimensional

KeyValue

Document Store

Object databases

Multimodel

XML Databases

Distributed infrastructure

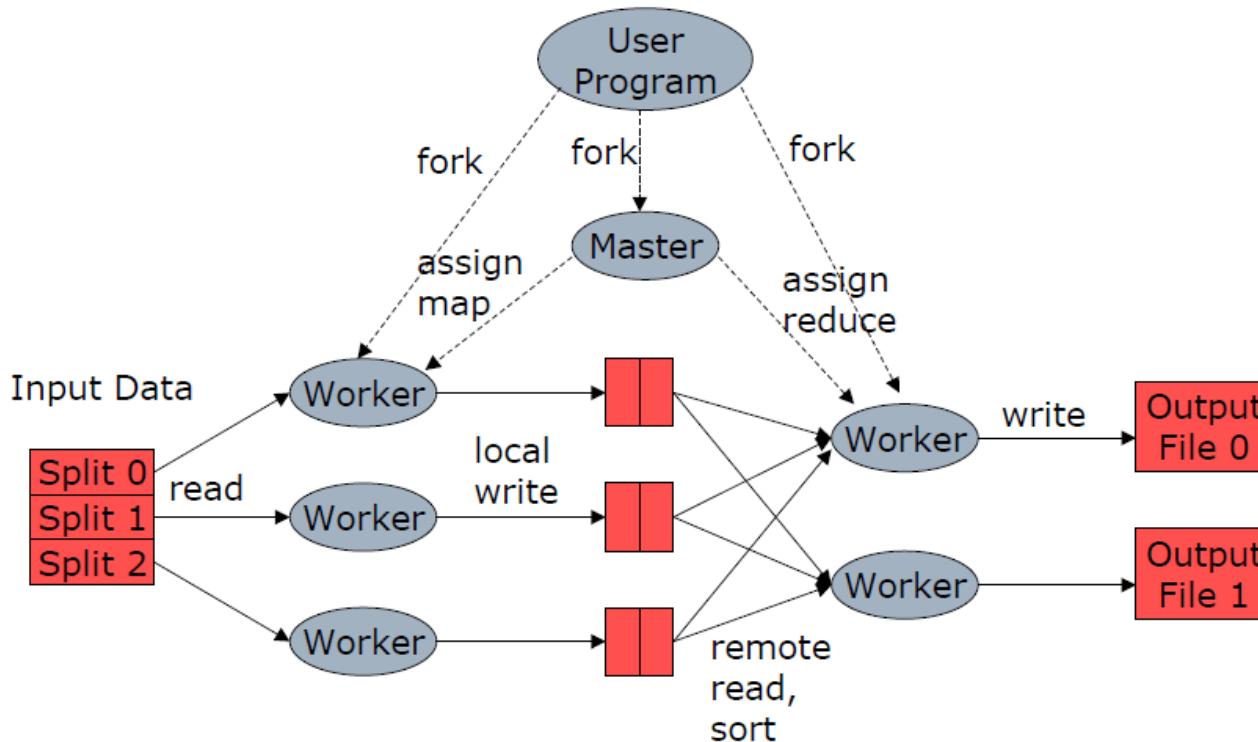

- ▶ Computing and storage are typically hosted transparently on cloud infrastructures
 - ...providing scale, flexibility and high fail-safety
- ▶ Distributed Servers
 - Amazon-EC2, Google App Engine, Elastic, Beanstalk, Heroku
- ▶ Distributed Storage
 - Amazon-S3, Hadoop Distributed File System

Distributed processing

- ▶ Distributed processing of Big-Data requires non-standard programming models
 - ...beyond single machines or traditional parallel programming models (like MPI)
 - ...the aim is to simplify complex programming tasks
- ▶ The most popular programming model is **MapReduce** approach
 - ...suitable for commodity hardware to reduce costs

MapReduce

- ▶ The key idea of the MapReduce approach:
 - A target problem needs to be parallelizable
 - First, the problem gets split into a set of smaller problems (Map step)
 - Next, smaller problems are solved in a parallel way
 - Finally, a set of solutions to the smaller problems get synthesized into a solution of the original problem (Reduce step)

MapReduce example: Counting words in documents

Google Maps charts
new territory into
businesses

Google selling new
tools for businesses
to build their own
maps

Google promises
consumer experience
for businesses with
Maps Engine Pro

Google is trying to get
its Maps service used
by more businesses

Google	4
Maps	4
Businesses	4

MapReduce example: Map task

Google Maps charts
new territory into
businesses

Businesses	2
Charts	1
Maps	2
Territory	1
...	

Google selling new
tools for businesses
to build their own
maps

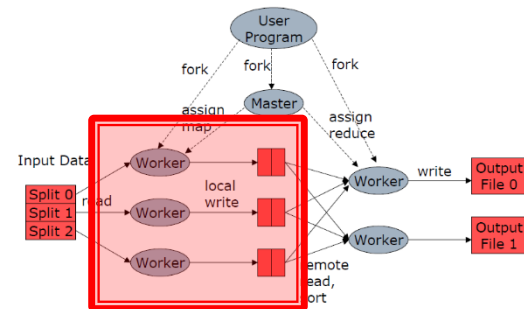

Google promises
consumer experience
for businesses with
Maps Engine Pro

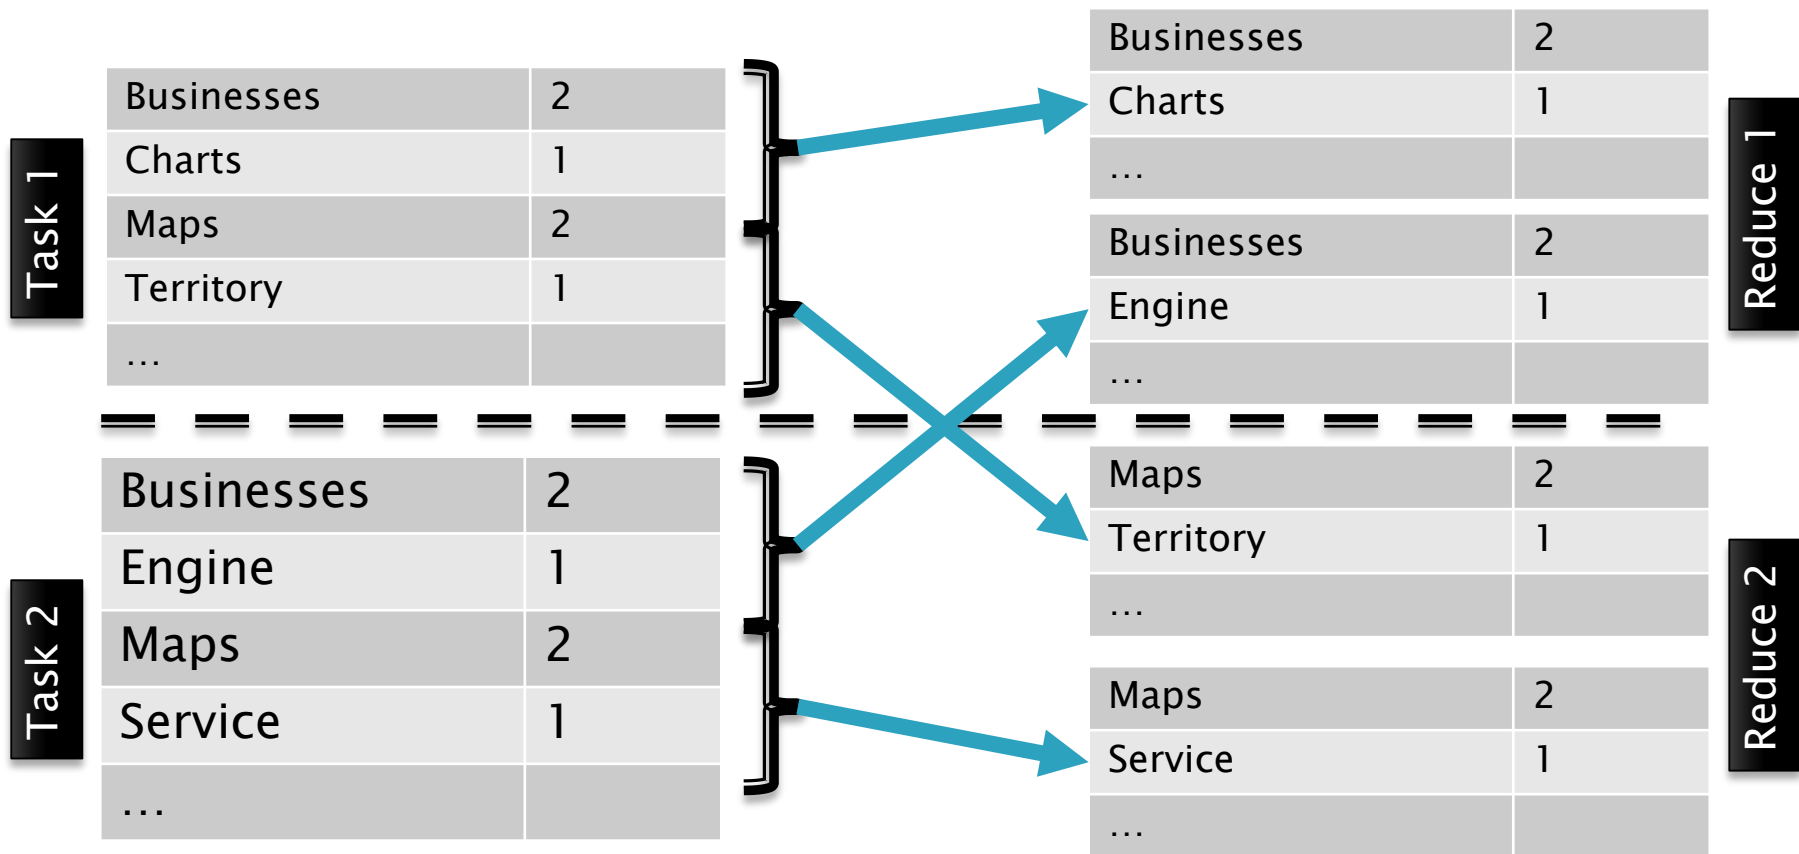

Businesses	2
Engine	1
Maps	2
Service	1
...	

Google is trying to get
its Maps service used
by more businesses

MapReduce example: Group and aggregate

- ▶ Split according to the hash of a key
- ▶ In our case: key = word, hash = first character

MapReduce example: Reduce task

Businesses	2
Charts	1
...	
Businesses	2
Engine	1
...	

Businesses	4
Charts	1
Engine	1
...	

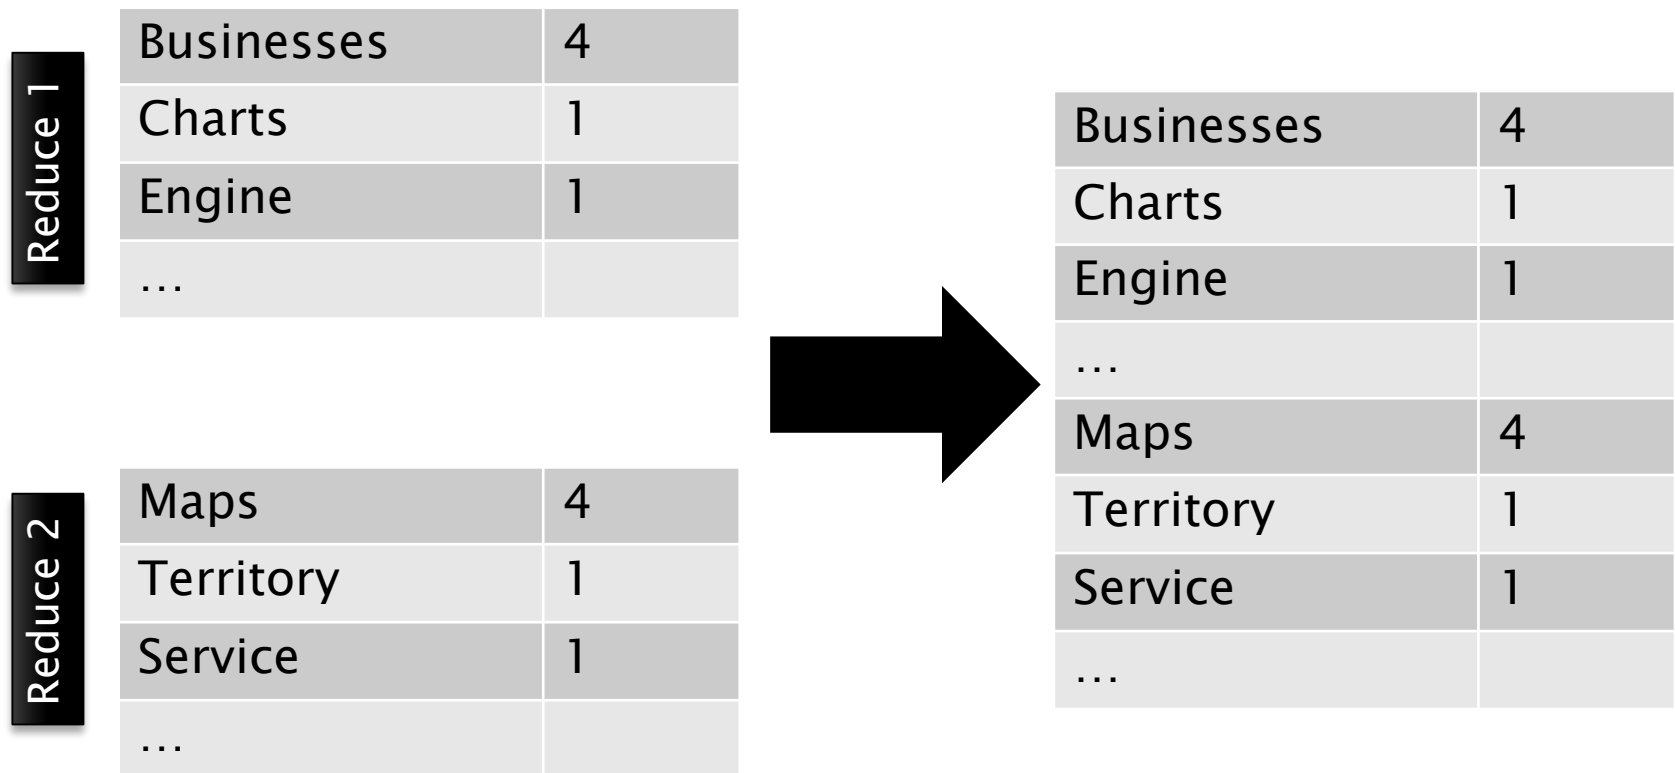

Maps	2
Territory	1
...	
Maps	2
Service	1
...	

Maps	4
Territory	1
Service	1
...	

MapReduce example: Combine

- ▶ We concatenate the outputs into final result

MapReduce Tools

- ▶ Apache Hadoop [<http://hadoop.apache.org/>]
 - Open-source MapReduce implementation
- ▶ Tools using Hadoop:
 - **Hive**: data warehouse infrastructure that provides data summarization and ad hoc querying (HiveQL)
 - **Pig**: high-level data-flow language and execution framework for parallel computation (Pig Latin)
 - **Mahout**: Scalable machine learning and data mining library
 - **Flume**: Flume is a distributed, reliable, and available service for efficiently collecting, aggregating, and moving large amounts of log data
 - Many more: Cascading, Cascalog, mrjob, MapR, Azkaban, Oozie, ...

History repeats

Hype on Databases from nineties == Hadoop from now

NoSQL Databases

- ▶ “[...] need to solve a problem that relational databases are a bad fit for”, Eric Evans
- ▶ Motives:
 - **Avoidance of Unneeded Complexity** – many use-case require only subset of functionality from RDBMSs (e.g ACID properties)
 - **High Throughput** – some NoSQL databases offer significantly higher throughput than RDBMSs
 - **Horizontal Scalability, Running on commodity hardware**
 - **Avoidance of Expensive Object-Relational Mapping** – most NoSQL store simple data structures
 - **Compromising Reliability for Better Performance**

Basic Concepts – Consistency

- ▶ **BASE approach**
 - Availability, graceful degradation, performance
 - Stands for “**B**asically available, **s**oft state, **e**ventual consistency”
- ▶ **Continuum of tradeoffs:**
 - **Strict** – All reads must return data from latest completed writes
 - **Eventual** – System eventually return the last written value
 - **Read Your Own Writes** – see your updates immediately
 - **Session** – RYOW only within same session
 - **Monotonic** – only more recent data in future requests

Basic Concepts – Partitioning

- ▶ Consistent hashing
 - Use same function for hashing objects and nodes
 - Assign objects to nearest nodes on the circle
 - Reassign object when nodes added or removed
 - Replicate nodes to r nearest nodes

Other Basic Concepts

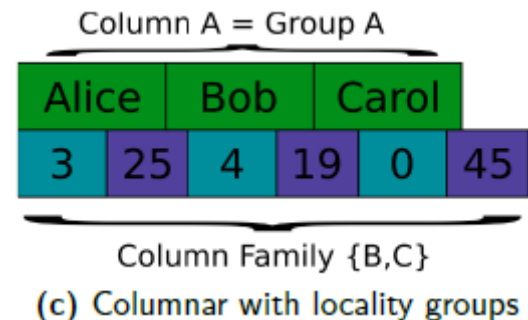

▶ Storage Layout

- Row-based
- Columnar
- Columnar with Locality Groups

▶ Query Models

- Lookup in key-value stores

▶ Distributed Data Processing via MapReduce

Key-Value Stores

- ▶ Map or dictionary allowing to add and retrieve values per keys
- ▶ Favor scalability over consistency
 - Run on clusters of commodity hardware
 - Component failure is “standard mode of operation”
- ▶ Examples:
 - Amazon Dynamo
 - Project Voldemort (developed by LinkedIn)
 - Redis
 - Memcached (not persistent)

Document Databases

- ▶ Combine several *key-value pairs* into *documents*
- ▶ Documents represented as JSON

```
" Title " : " CouchDB " ,  
" Last editor " : "172.5.123.91" ,  
" Last modified " : "9/23/2010" ,  
" Categories " : [ " Database " , " NoSQL " , " Document Database " ],  
" Body " : " CouchDB is a ..." ,  
" Reviewed " : false
```

- ▶ Examples:
 - Apache CouchDB
 - MongoDB

Column-Oriented

- ▶ Using columnar storage layout with locality groups (column families)
- ▶ Examples:
 - Google Bigtable
 - Hypertable, HBase
 - open source implementation of Google Bigtable
 - Cassandra
 - combination of Google Bigtable and Amazon Dynamo
 - Designed for high write throughput

Open Source Big Data Tools

Infrastructure:

- ▶ Kafka [<http://kafka.apache.org/>]
 - A high-throughput distributed messaging system
- ▶ Hadoop [<http://hadoop.apache.org/>]
 - Open-source map-reduce implementation
- ▶ Storm [<http://storm-project.net/>]
 - Real-time distributed computation system
- ▶ Cassandra [<http://cassandra.apache.org/>]
 - Hybrid between Key-Value and Row-Oriented DB
 - Distributed, decentralized, no single point of failure
 - Optimized for fast writes

Open Source Big Data Tools

Machine Learning

- ▶ Mahout
 - Machine learning library working on top of Hadoop
 - <http://mahout.apache.org/>
- ▶ MOA
 - Mining data streams with concept drift
 - Integrated with Weka
 - <http://moa.cms.waikato.ac.nz/>

Mahout currently has:

- Collaborative Filtering
- User and Item based recommenders
- K-Means, Fuzzy K-Means clustering
- Mean Shift clustering
- Dirichlet process clustering
- Latent Dirichlet Allocation
- Singular value decomposition
- Parallel Frequent Pattern mining
- Complementary Naive Bayes classifier
- Random forest decision tree based classifier

Data Science

Life as an Analyst

Defining Data Science

- ▶ Interdisciplinary field using techniques and theories from many fields, including math, statistics, data engineering, pattern recognition and learning, advanced computing, visualization, uncertainty modeling, data warehousing, and high performance computing with the goal of extracting meaning from data and creating data products.
- ▶ Data science is a novel term that is often used interchangeably with competitive intelligence or business analytics, although it is becoming more common.
- ▶ Data science seeks to use all available and relevant data to effectively tell a story that can be easily understood by non-practitioners.

Statistics vs. Data Science

	Statistician	Data Scientist
Image	Baseball (Cricket)	HBR Sexiest Job of 21 st Century
Mode	Reactive	Consultative
Works	Solo	In a team
Inputs	Data File, Hypothesis	A Business Problem
Data	Pre-prepared, clean	Distributed, messy, unstructured
Data Size	Kilobytes	Gigabytes
Tools	SAS, Mainframe	R, Python, awk, Hadoop, Linux, ...
Nouns	Tables	Data Visualizations
Focus	Inference (why)	Prediction (what)
Output	Report	Data App / Data Product
Latency	Weeks	Seconds
Stars	G.E.P Box Trevor Hastie	Hilary Mason Nate Silver

Business Intelligence vs. BI

	Business Intelligence	Data Science
Perspective	Looking backwards	Looking forwards
Actions	Slice and Dice	Interact
Expertise	Business User	Data Scientist
Data	Warehoused, Siloed	Distributed, real-time
Scope	Unlimited	Specific business question
Questions	What happened?	What will happen? What if?
Output	Table	Answer
Applicability	Historic, possible confounding factors	Future, correcting for influences

Video Gamers' Prolonged Play Raises Risk of Depression, Anxiety

By Elizabeth Lopatto - Jan 17, 2011 6:00 AM GMT+0100

[f](#) Recommend 48 [t](#) Tweet 27 [in](#) Share 2 [More](#) [Email](#) [Print](#)

About 9 percent of children play such long hours of video games that they are pathological gamers, increasing risks of anxiety, depression, bad grades and social phobia, a study in [Singapore](#) found.

The compulsive gamers played for a weekly average of 31 hours compared with 19 for kids not deemed pathological, according to research released today by the journal [Pediatrics](#). Overall, 83 percent of 3,034 children in the study played video games at least occasionally.

Gamers are considered pathological when their playing interferes with everyday life, and their behavior is described as being similar to that of gambling addicts, according to background information in the paper. The gaming isn't merely a symptom of disorders such as depression, anxiety and social phobia, today's study found. Rather, gaming can cause and reinforce those maladies.

"Although children who are depressed may retreat into gaming, the gaming increases the depression," wrote the study authors, led by [Douglas A. Gentile](#), a psychologist at [Iowa State University](#), in Ames.

The study, of children in grades 3, 4, 7 and 8, lasted two years. Kids who stopped being pathological gamers during the study period showed lower levels of depression, anxiety and social phobia compared with peers who didn't stop, the researchers said.

Video Gamers' Prolonged Play Raises Risk of Depression, Anxiety

By Elizabeth Lopatto - Jan 17, 2011 6:00 AM GMT+0100

[f](#) Recommend 48 [t](#) Tweet 27 [in](#) Share 2 [More](#) [Email](#) [Print](#)

About 9 percent of children play such long hours of video games that they are pathological gamers, increasing risks of anxiety, depression, bad grades and social phobia, a study in [Singapore](#) found.

The compulsive gamers played for a weekly average of 31 hours compared with 19 for kids not deemed pathological, according to research released today by the journal [Pediatrics](#). Overall, 83 percent of 3,034 children in the study played video games at least occasionally.

Gamers are considered pathological when their playing interferes with everyday life, and their behavior is described as being similar to that of gambling addicts, according to background information in the paper. The gaming isn't merely a symptom of disorders such as depression, anxiety and social phobia, today's study found. Rather, gaming can cause and reinforce those maladies.

"Although children who are depressed may retreat into gaming, the gaming increases the depression," wrote the study authors, led by [Douglas A. Gentile](#), a psychologist at [Iowa State University](#), in [Ames](#).

The study, of children in grades 3, 4, 7 and 8, lasted two years. Kids who stopped being pathological gamers during the study period showed lower levels of depression, anxiety and social phobia compared with peers who didn't stop, the researchers said.

Demographics Example

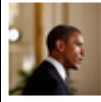

- ▶ Provided only for registered users
 - Only some % of unique users typically register
- ▶ Each registered users described with:
 - Gender
 - Year of birth
 - Household income

- ▶ Noisy

Gender	<input checked="" type="radio"/> Male <input type="radio"/> Female
Year of Birth	<input type="text" value="1965"/>
Zip Code	<input type="text" value="10017"/>
Country of Residence	<input type="text" value="United States"/> ▼
Household Income	<input type="text" value="\$100,000 to \$149,999"/> ▼
Job Industry	<input type="text" value="Accounting"/> ▼
Job Title	<input type="text" value="Accountant/Auditor"/> ▼
Company Size	<input type="text" value="--- Select One ---"/> ▼

News recommendation

- ▶ List of articles based on
 - Current article
 - User's history
 - Other Visits
- ▶ In general, a combination of **text stream** (news articles) with **click stream** (website access logs)
- ▶ The key is a rich context model used to describe user

MOST E-MAILED	RECOMMENDED FOR YOU
	1. GAIL COLLINS Small Is So Beautiful
	2. EDITORIAL The Need to Agree to Agree
	3. Parties' Tactics Eroding Unity Left and Right
	4. PAUL KRUGMAN Policy and the Personal
	5. A Reality Series Finds Silicon Valley Cringing
	6. YOU'RE THE BOSS This Week in Small Business: Managing Millennials
	7. CHARLES M. BLOW What a Tangled Web
	8. BITS Google and F.T.C. Set to Settle Safari Privacy Charge

Why news recommendation?

- ▶ “Increase in engagement”
 - Good recommendations can make a difference when keeping a user on a web site
 - Measured in number of articles read in a session
- ▶ “User experience”
 - Users return to the site
 - Harder to measure and attribute to recommendation module
- ▶ Predominant success metric is the attention span of a user expressed in terms of time spent on site and number of page views.

Why is it hard?

- ▶ Cold start
 - Recent news articles have little usage history
 - More severe for articles that did not hit homepage or section front, but are still relevant for particular user segment
- ▶ Recommendation model must be able to generalize well to new articles.

Example: Bloomberg.com

- ▶ Access logs analysis shows, that half of the articles read are less then ~8 hours old
- ▶ Weekends are exception

User profile

- ▶ History
 - Time
 - Article
- ▶ Current request:
 - Location
 - Requested page
 - Referring page
 - Local Time

Features

- ▶ Each article from the time window is described with the following features:
 - Popularity (user independent)
 - Content
 - Meta-data
 - Co-visits
 - Users
- ▶ Features computed by comparing article's and user's feature vectors
- ▶ Features computed on-the-fly when preparing recommendations

Algorithm

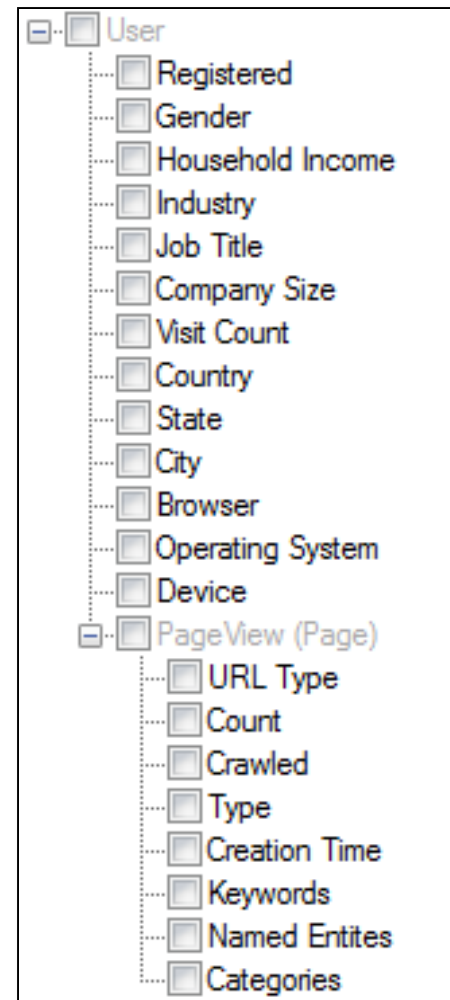

Evaluation

- ▶ Measure how many times one of top 4 recommended article was actually read

1	2-10	11-50	51-
21%	24%	32%	37%

User Modeling

- ▶ Feature space
 - Extracted from subset of fields
 - Using vector space model
 - Vector elements for each field are normalized
- ▶ Training set
 - One visit = one vector
 - One user = a centroid of all his/her visits
 - Users from the segment form positive class
 - Sample of other users form negative class
- ▶ Classification algorithm
 - Support Vector Machine
 - Good for dealing with high dimensional data
 - Linear kernel
 - Stochastic gradient descent
 - Good for sampling

Experimental setting

- ▶ Real-world dataset from a major news publishing website
 - 5 million daily users, 1 million registered
- ▶ Tested prediction of three demographic dimensions:
 - Gender, Age, Income
- ▶ Three user groups based on the number of visits:
 - ≥ 2 , ≥ 10 , ≥ 50
- ▶ Evaluation:
 - Break Even Point (BEP)
 - 10-fold cross validation

Network: Small-world

- ▶ 6 degrees of separation [Milgram '60s]
- ▶ Average distance between two random users is 6.6
- ▶ 90% of nodes can be reached in < 8 hops

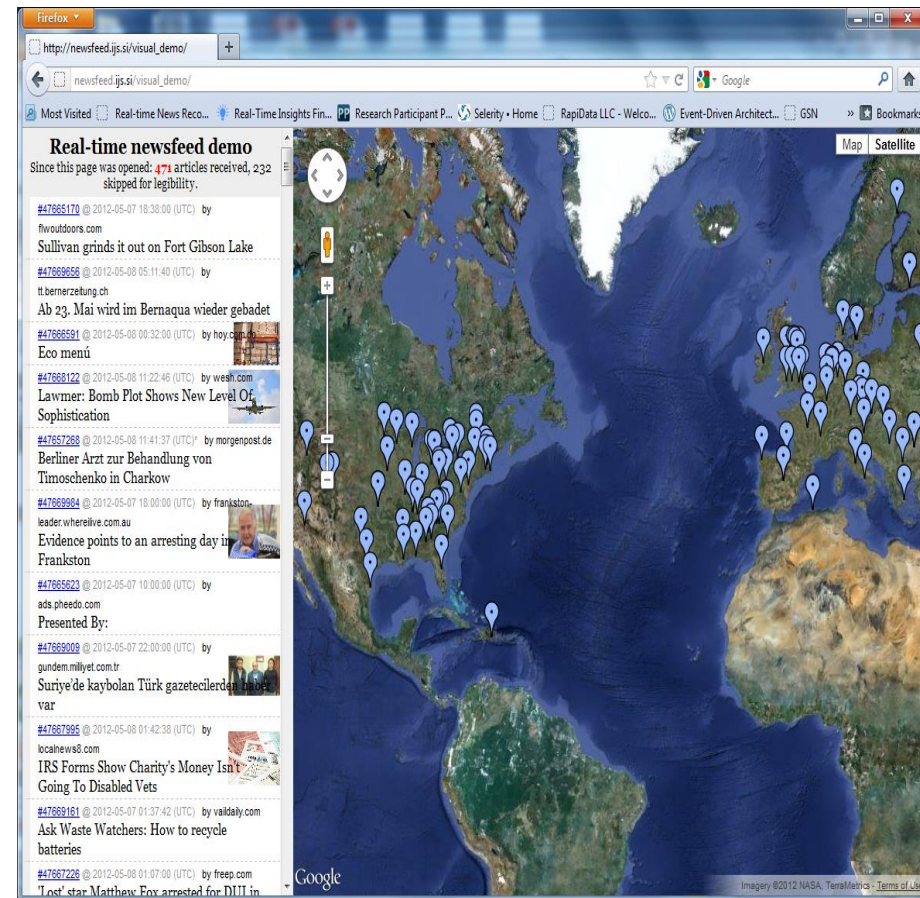

Application: Global Media Monitoring

Application: Monitoring global media

- ▶ The aim of the project is to collect and analyze global main-stream and social media
 - ...documents are crawled from 100 thousands of sources
 - ...each crawled document gets cleaned, linguistically and semantically enriched
 - ...we connect documents across languages (cross-lingual technology)
 - ...we identify and connect events

Collecting global media in near-real-time (<http://newsfeed.ijs.si>)

- ▶ The NewsFeed.ijs.si system collects
 - 40.000 main-stream news sources
 - 250.000 blog sources
 - Twitter stream
- ▶ ...resulting in ~500.000 documents + #N of twits per day
- ▶ Each document gets cleaned, linguistically and semantically annotated

Semantic text enrichment (DBpedia, OpenCyc, ...) with Enrycher (<http://enrycher.ijs.si/>)

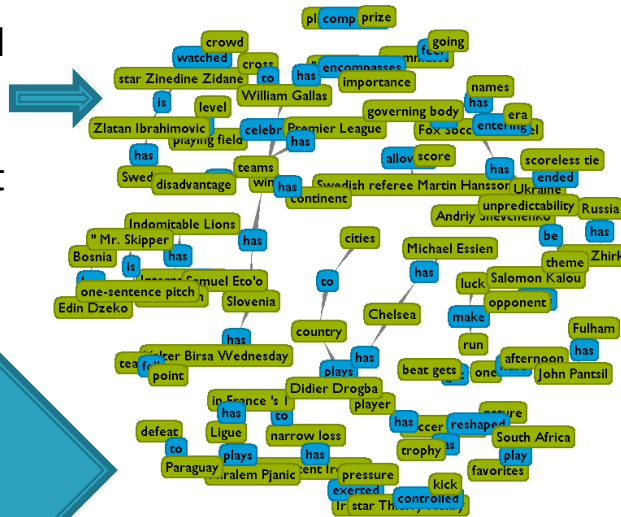

Plain text

Slovenia's dramatic win over Russia Wednesday, and to a lesser extent Ireland's narrow loss to France, capped off a grueling two-year qualifying period that saw some of the smallest countries in the world kick some of soccer's biggest names in the teeth. After a century of foreign domination from the likes of Brazil, Italy and Germany, interrupted by a brief interlude entering the era of the Cinderella. It may not happen again, but given the increasing flow of talent, training and coaching across borders, it's almost certain that a small upstart nation will eventually have athletes and better luck will make a legitimate run for the coveted trophy.

Russia's Yuri Zhirkov, right, fights for the ball with Slovenia's Valter Birsa Wednesday.

Final thoughts

Literature on Big-Data

...to conclude

- ▶ Big-Data is everywhere, we are just not used to deal with it
- ▶ The “Big-Data” hype is very recent
 - ...growth seems to be going up
 - ...evident lack of experts to build Big-Data apps
- ▶ Can we do “Big-Data” without big investment?
 - ...yes – many open source tools, computing machinery is cheap (to buy or to rent)
 - ...the key is knowledge on how to deal with data
 - ...data is either free (e.g. Wikipedia) or to buy (e.g. twitter)
