Activities: 1) drinking, 2) writing bestselling literary fiction, 3) coding part time for the big bucks
Interests: photography, cooking, novels, chess, videogames, anime, computers, scuba diving

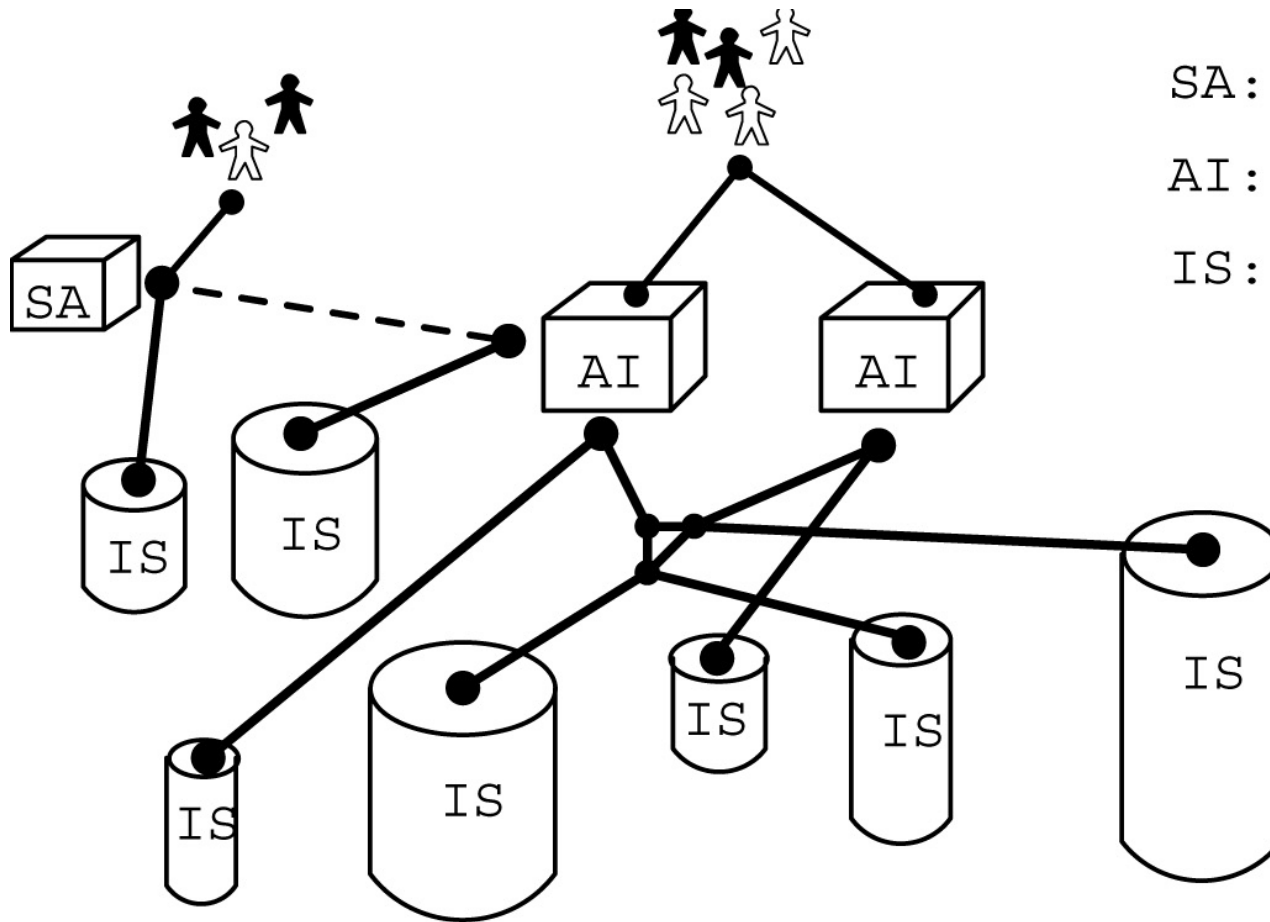

Hector's Challenges

Goal of SDILIP

- The goal of the Stanford Integrated Digital Library Project (SIDLP) is to develop the enabling technologies for a single, integrated and “universal” library, composed from the large numbers of emerging individual heterogeneous repositories.
- Our definition of a constituent repository is broad enough to include everything from personal information collections (e.g., a file of electronic messages) to the collections that one finds today in conventional libraries to the large data collections shared by scientists.

Digital Libraries in 1993

SA: Service Application

AI: Access Interface

IS: Information Source

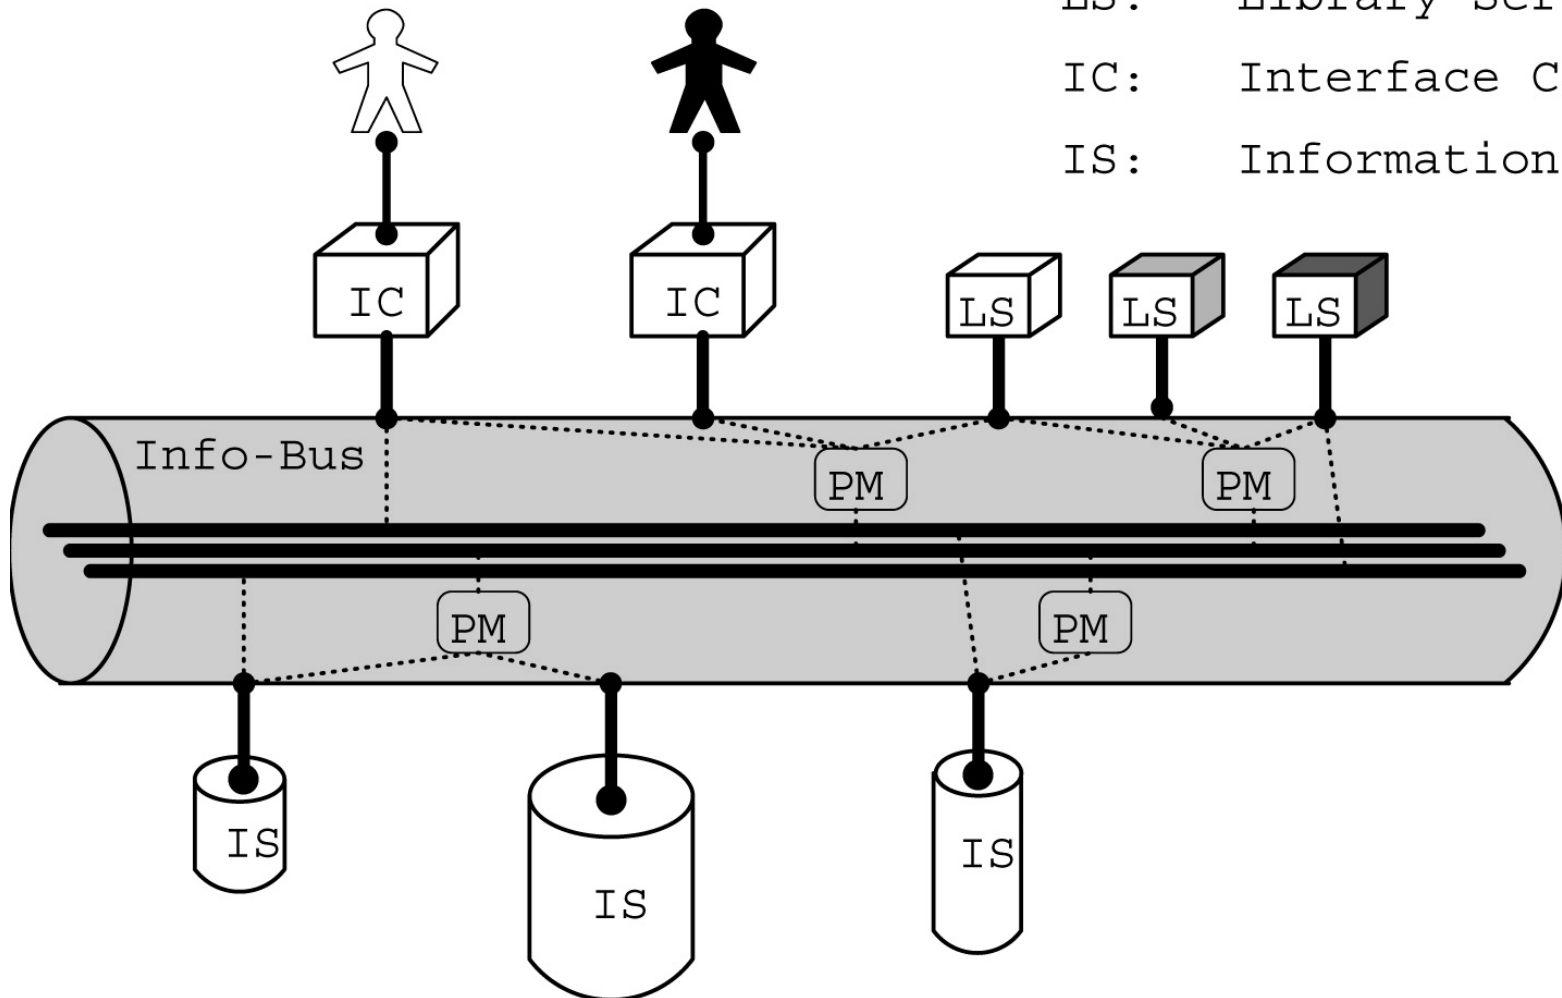

Proposed InfoBus

PM: Protocol Mach

LS: Library Serv

IC: Interface Cl

IS: Information

Alternative to InfoBus

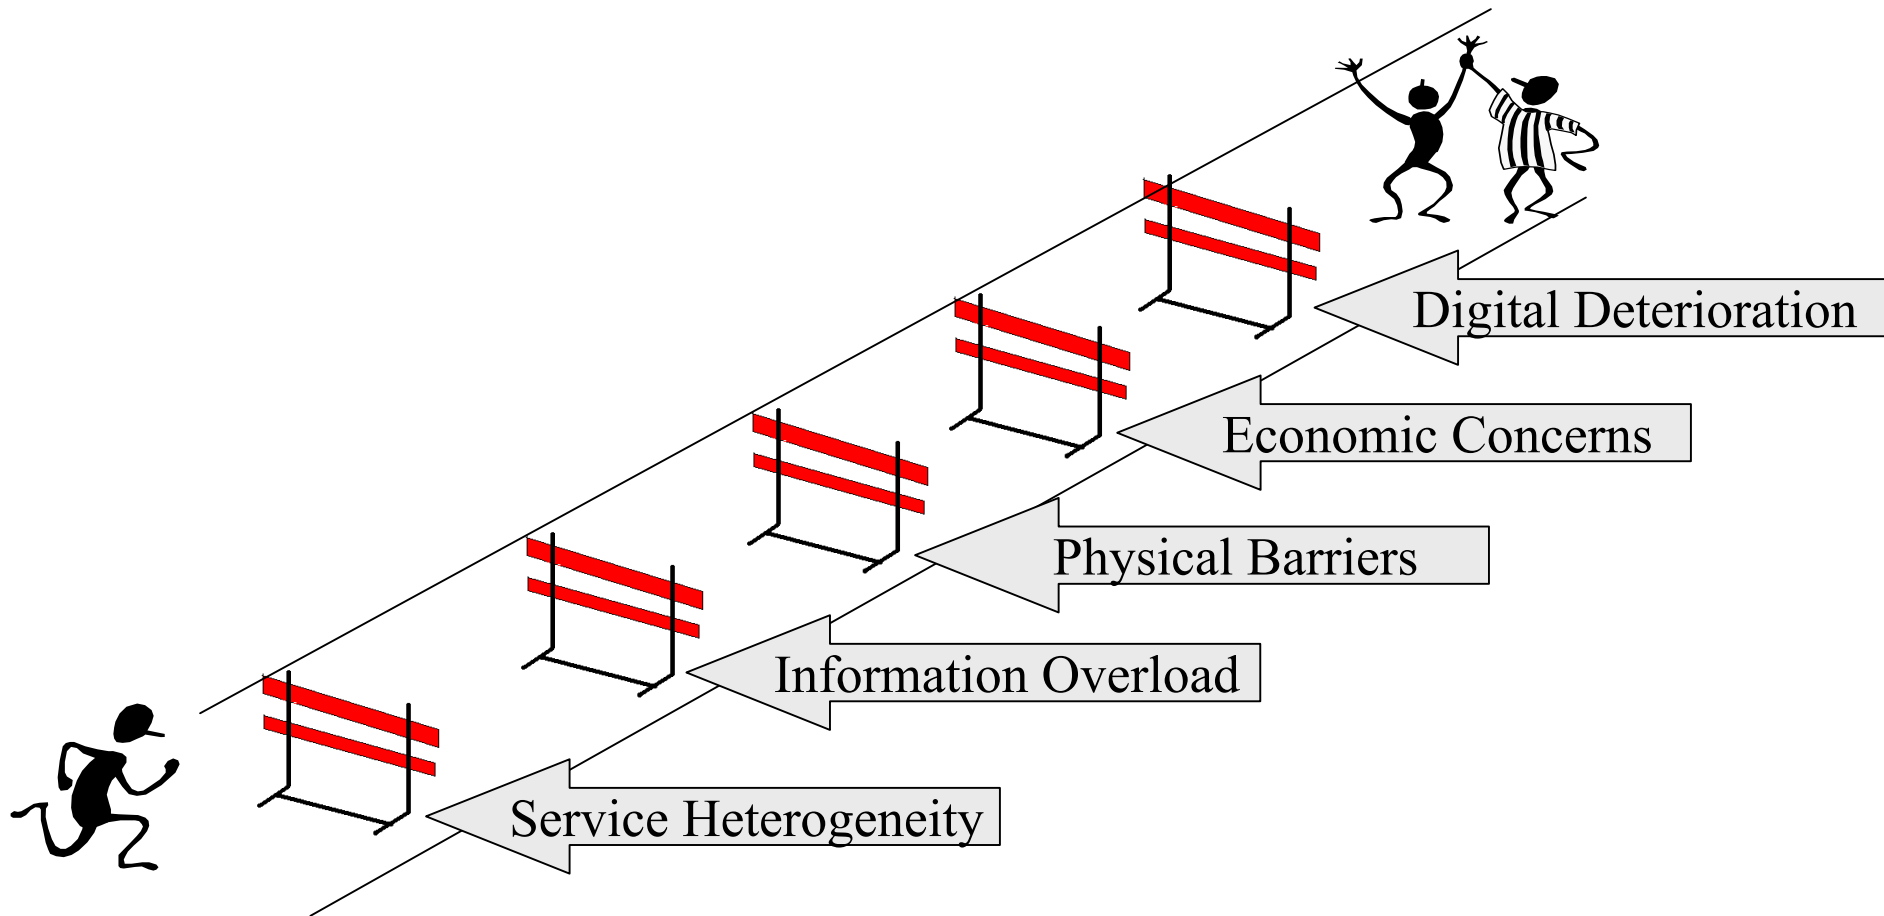

Challenging Problems (1993) Part 1

- What is the proper architecture for the Digital Library?
- What are appropriate models for documents (and more generally information) and library services?
- What protocols for interoperation between repositories, libraries, and services are required?
- What are the best human interfaces to such an integrated library?

Challenging Problems (1993) Part 2

- Making the Digital Library economically viable?
- How does one locate information of interest, in a very large, distributed, and possibly disconnected collection of repositories?
- How does one represent and manipulate the information processing “activities” that occur or will occur in a Digital Library?

Challenging Problems (1998)

Challenging Problems (1998) Part 1

- Service Heterogeneity
 - Different formats, protocols
- Information Overload
 - User's search may return huge numbers of documents
- Physical Barriers
 - User may not be at his desk, or may be connected with insufficient bandwidth and local processing capacity

Challenging Problems (1998) Part 2

- Economic Concerns
 - Document not available due to security or intellectual property protection concerns
- Digital Deterioration
 - The document may have been available in the past, but is now lost.

Challenging Problems 2008 (Part 1)

- Beyond Search
 - identifying user task/intention
 - document/word semantics
- Information Integration
 - extraction, entity resolution
 - combining results
- Monetizing
 - ads, bids,...
 - spam, click fraud

Challenging Problems 2008 (Part 2)

- Social Networks
 - modeling
 - wisdom of the crowds
- Data Mining
 - media mining
 - mining graphs
- Privacy
 - safe data mining
 - protecting identity

Challenging Problems 2008 (Part 3)

- Coping with Scale
 - power minimization
 - revisiting distributed databases
- Personalization
 - access to personal data
 - tailoring services to me
- Mobile Access
 - small devices
 - peer-to-peer libraries

Ranking Challenges

Highest Impact (If Solved)

1 • Beyond Search

2 • Information Integration

3 • Monetizing

4 • Social Networks

• Data Mining ←———— **low**

• Privacy ←———— **low**

5 • Coping with Scale

• Personalization ←———— **low**

• Mobile Access ←———— **low**

Hardest Problems to Solve

2 • Beyond Search

1 • Information Integration

3 • Monetizing

4 • Social Networks

• Data Mining ←———— easy

5 • Privacy

• Coping with Scale ←———— easy

• Personalization ←———— easy

• Mobile Access ←———— easy

Random Thought 1: Convergence

- DBMSs have IR facilities
- search engines building own DBMS
 - e.g., map-reduce, big table

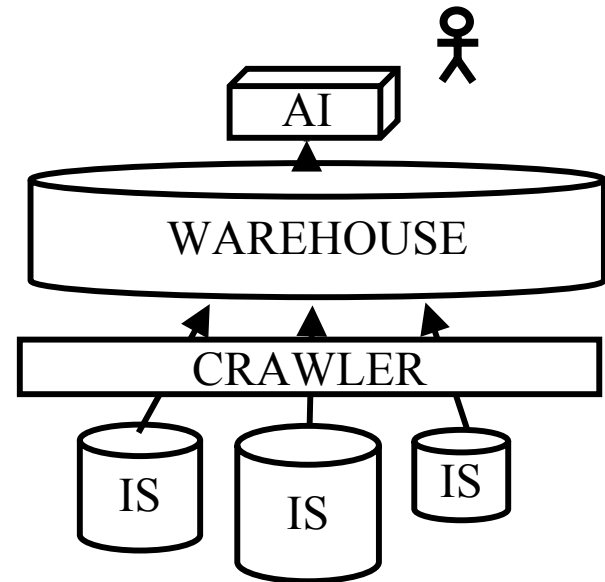

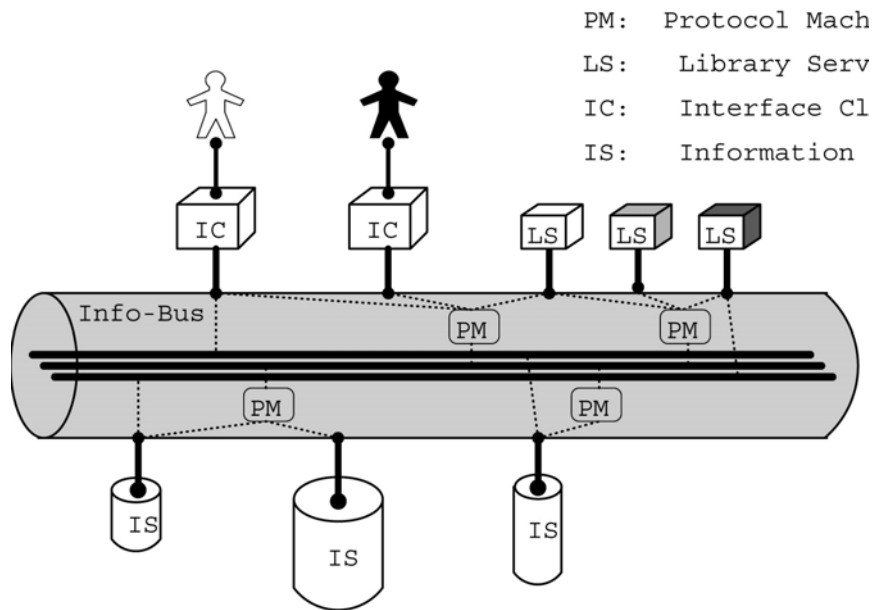

Random Thought 2: Getting Harder

- Web pages more complex
 - less text, flash, ajax, jpgs, deep web,...
 - harder to crawl, index, interpret
- Low Hanging Fruit Taken
 - harder to improve precision, recall
 - more constraints: privacy, mobility,...

Though 3: Back To The Future?

- Is it time to revisit the InfoBus?

Stanford InfoLab Activities

- CourseRank
- PhotoSpread
- Tagging Systems
- Combating Spam
- Entity Resolution
- Sociologist's Workbench
- Privacy
- Uncertain Data
- and much more!

CourseRank: The Unofficial Course Guide

Now officially supported by Stanford University.

Over the past quarter, CourseRank joined forces with Stanford's InfoLab Group. Led by professor Hector Garcia-Molina and with the aid and cooperation of Stanford's administration / ASSU, a new and improved CourseRank is finally here.

★★★★★ Autumn 2007-2008 | Sahami, M | A +5 Reputation

I took this class with Sahami, and I found lectures extremely engaging and fun. Section was boring at times, but the section problems are also pretty interesting, and usually helpful for assignments. I agree with the comment below that most of the class seemed to have already had programming experience, but you definitely could still love it and enjoy it if you didn't have any. My friends and I did! Being able to write and show off Break Out after only a month of programming is an amazing feeling!

★★★★☆ Autumn 2007-2008 | Sahami, M | B +4 Reputation

I totally agree with whoever commented below. I found that about 80% or more of the class had already had some programming experience. I walked in without even knowing what coding was and I found this class really difficult and time consuming. The class was definitely quite interesting and a heck of a learning experience, but make sure you're willing to put in a lot of time.

User had not rated this course at the time of commenting -9 Reputation

People who enjoy this class are most of the time ones who are inclined towards programming. I definitely believe that for some people, it is just really hard and unpleasant. I found this class extremely difficult and annoying. In my opinion, it should NOT be mandatory for all engineering majors.

This class was a really awesome class. Prof. Sahami is an amazingly dynamic lecturer. He makes class not only interesting but fun. This was my first class relating to CS, and I absolutely loved it. The assignments are fun. The exam style is a bit annoying though.
