Overview

Introduction Symmetries in MDPs Experiments and Results Conclusions

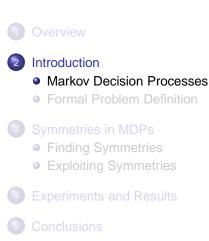

Markov Decision Processes (MDPs)

- Used to model sequential decision problems
- Current solution techniques do not scale well with the size of the MDP
- Real world problems when modeled as MDPs exhibit high degree of redundancy
- Reduction in size possible if we exploit redundancy
- Finding Symmetries in MDPs
 - We use the symmetry as a notion of redundancy as introduced in (Ravindran, 2004)
 - Believed to be hard however exact hardness is unknown
 - Intuitively, because of the additional structure of MDPs it seems harder
- We show that finding symmetries in MDPs is no harder than the problem of Graph Isomorphism (GI)
- We also show the use of existing GI solvers for finding symmetries in MDPs

Markov Decision Processes Formal Problem Definition

Reduced Model - Formal definition

Definition

An MDP homomorphism from \mathscr{M} to \mathscr{M}' is a surjection $h: \Psi \to \Psi'$ defined by $h(s, a) = (f(s), g_s(a))$, where $f: S \to S'$ and $g_s: A_s \to A'_{f(s)}$ are surjections satisfying,

$$\begin{array}{lll} {\sf P}'(f(s),g_{\rm s}(a),f(s')) & = & \sum\limits_{s''\in f^{-1}(f(s'))} {\sf P}(s,a,s'') \\ \\ {\sf R}'(f(s),g_{\rm s}(a)) & = & {\sf R}(s,a) \end{array}$$

Definition

An MDP \mathscr{M}' is said to be a *reduced model* of an MDP \mathscr{M} , iff there exists an MDP homomorphism $h: \mathscr{M} \to \mathscr{M}'$.

Shravan M Narayanamurthy, Balaraman Ravindran On the Hardness of Finding Symmetries in Markov Decision Processes

Markov Decision Processes Formal Problem Definition

Reduced Model - Significance

Reduced Model:

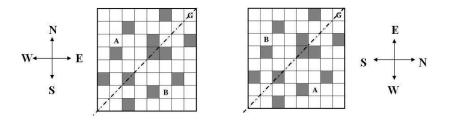

- Preserves dynamics by definition
- Preserves optimal value functions and policies
- Functionally equivalent to the original model but significantly smaller

Markov Decision Processes Formal Problem Definition

Symmetry Formal Definition

Definition

A bijective MDP homomorphism from \mathscr{M} to \mathscr{M} is called an MDP automorphism which represents a symmetry. We have,

$$\begin{array}{lll} P(f(s),g_{s}(a),f(s')) &=& P(s,a,s') \\ R(f(s),g_{s}(a)) &=& R(s,a) \end{array}$$

Definition

The set of all automorphisms of an MDP, \mathscr{M} , form a group under composition called the automorphism group of \mathscr{M} , represented as Aut \mathscr{M} . The orbits of the natural action of any subgroup \mathscr{G} on $\mathscr{M}(\Psi)$ defines a partition $\mathcal{B}_{\mathscr{G}}$ of Ψ using which a quotient MDP $\mathscr{M}/\mathcal{B}_{\mathscr{G}}$, called the \mathscr{G} -Reduced Image can be defined.

Finding Symmetries Exploiting Symmetries

Set Bijections

- A generator of Aut M has 2 components:
 - A function *f* that permutes the states
 - A set of functions {*g_u*} that permute the actions called the State-Dependent Action Recoding (SDAR) functions.
- Solution to DGEN(G) accounts only for f
- Factorially many SDAR functions in the worst case, rendering explicit representations useless
- To obtain the SDAR functions, we define the notion of a set bijection
- Represents a set of bijections compactly
- Polynomially computable operations of intersection, composition and inverse

Finding Symmetries Exploiting Symmetries

Set Bijections example

For example, the following set of bijections from $A = \{1, 2, 3, 4\}$ to $B = \{N, E, W, S\}$

$$\begin{array}{lll} 1 \rightarrow N, & 2 \rightarrow E, & 3 \rightarrow W, & 4 \rightarrow S \\ 1 \rightarrow N, & 2 \rightarrow E, & 3 \rightarrow S, & 4 \rightarrow W \\ 1 \rightarrow E, & 2 \rightarrow N, & 3 \rightarrow W, & 4 \rightarrow S \\ 1 \rightarrow E, & 2 \rightarrow N, & 3 \rightarrow S, & 4 \rightarrow W \end{array}$$

can be represented compactly using a set bijection , X_1 , from $U_A^1 = \{\{1,2\},\{3,4\}\}$ to $U_B^1 = \{\{N,E\},\{W,S\}\}$ as follows:

$$X_1(\{1,2\}) = \{N,E\}$$

 $X_1(\{3,4\}) = \{W,S\}$

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

Finding Symmetries Exploiting Symmetries

Construction provides the Generators of Aut *M* Outline of the proof

- Prove that Aut \mathcal{M} can be partitioned into $\{ < f, \{G_u\} > \}$.
- **2** Define a group homomorphism $\phi : Aut\mathcal{M} \to AutWG$.
- Prove that Aut *M* as partitioned above represents the set of all cosets of the kernel, ker(\u03c6).
- Since, the kernel is a normal subgroup, we know that, $Aut \mathcal{M} / ker(\phi) \cong im(\phi).$
- Using the isomorphism, prove that the set {< f, {G_u} >} found using the above procedure is the set of generators of Aut*M*.

イロト イポト イヨト イヨト

Finding Symmetries Exploiting Symmetries

Significance

- Theoretically significant
- Allows the use of off-the-shelf Graph Isomorphism solvers to find symmetries on MDPs.

(日)

Finding Symmetries Exploiting Symmetries

Nauty - No Automorphisms, Yes?

- Solves DGEN
 - Worst case complexity is exponential
 - On avg on a graph of *n* vertices takes *n*² time
- Uses backtracking and a refinement procedure to find the canonical labelings
- Allows the use of a variety of vertex invariants to solve harder problems

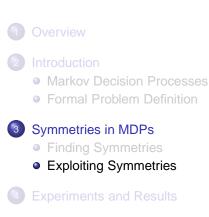

Finding Symmetries Exploiting Symmetries

Nauty Integration

- Construct the weighted pesudograph from the given MDP
- Construct the weighted digraph using the above procedure
- Construct a simple digraph from the weighted digraph using standard procedure
- Get the generators of the digraph using Nauty
- Use set bijections to find state-dependent action recoding functions for each generator
- Senerate the partition of $|\Psi|$ induced by the group generated by the above functions
- Use the partition to construct a reduced model and follow explicit model minimization

Finding Symmetries Exploiting Symmetries

G-Reduced Image Algorithm

- Given an MDP *M* and a Symmetry Group *G*, finds the reduced model *M*' induced by *G*
- Straightforward way by explicit enumeration takes $|\Psi| \times |\mathscr{G}|$
- Breadth First Search with pruning
- Terminates when at least one representative from each equivalence class of \mathscr{G} has been examined
- With certain assumptions time complexity is O(|Ψ'|×|𝔅|)

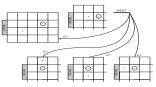

イロト イポト イヨト イヨト

Experimental Setup - Probabilistic GridWorld

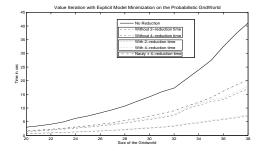

- States: An *N* × *N* GridWorld
- Actions: Four probabilistic actions of going UP, DOWN, RIGHT and LEFT having a 90% success probability
- Initial state: (0,0)
- Goal states: $\{(0, N-1), (N-1, 0)\}$.

Experimental Setup - GridWorld Soccer

- Slightly modified version of that described in (Bowling, 2003) with an *M* × *N* grid with two agents (Attacker-A and Defender-B)
- States: The non-identical positions of the attacker and the defender leading to $(MN)^2 (MN)$ states
- Actions: The four compass directions: N, E, W, S and the hold action H
- Goal States: W action from the squares in front of the goal

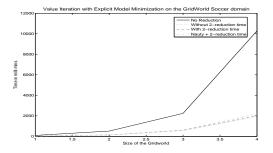

Results - Probabilistic GridWorld

- Able to find the partition corresponding to the symmetry group
- For a grid of size N × N, states (x,y), (y,x), (N-1-x,N-1-y) and (N-1-y,N-1-x) are equivalent

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

Results - GridWorld Soccer

- Intuition gets it wrong; domain is not symmetric!
- The algorithm also finds another interesting symmetry due to the existence of the hold action.

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

- In this work, we have provided a constructive proof for the Isomorphism Completeness of the problem of finding symmetries.
- We have also proposed the use of this constructive proof along with an efficient minimization algorithm to solve an MDP using symmetries and demonstrated it empirically.
- We are looking at adapting approximation algorithms for finding graph isomorphisms to finding approximate symmetries in MDPs.

Thank You!
