

Adaptive Networks

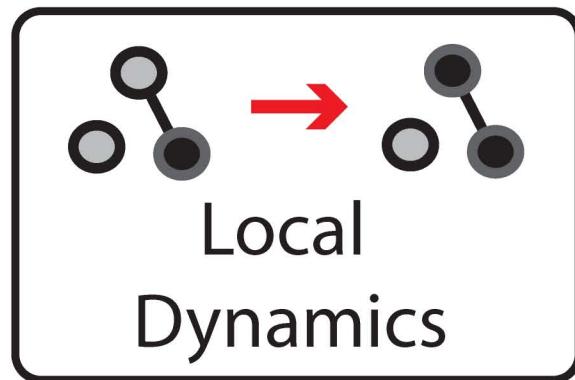

The intriguing interplay of the dynamics ON and OF networks

Thilo Gross

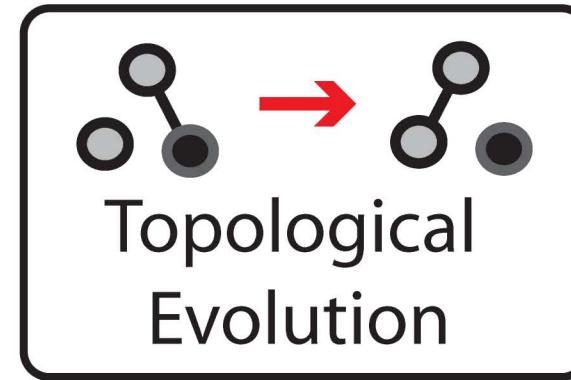

*Max-Planck-Institut für die
Physik komplexer Systeme, Dresden.*

Dynamical Networks have two different faces.

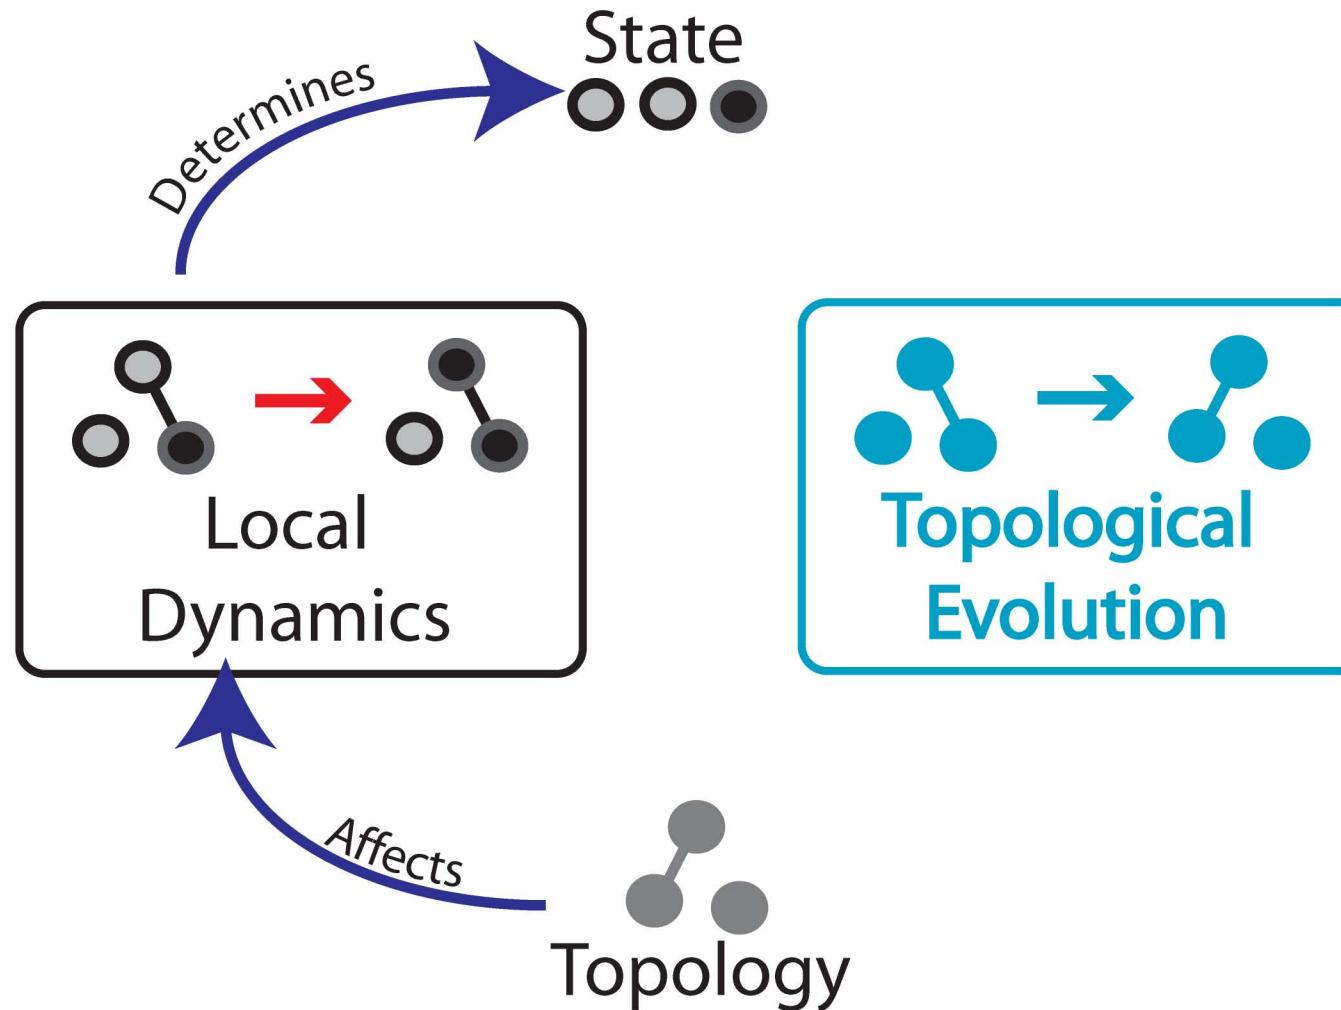

Dynamics **ON** Networks

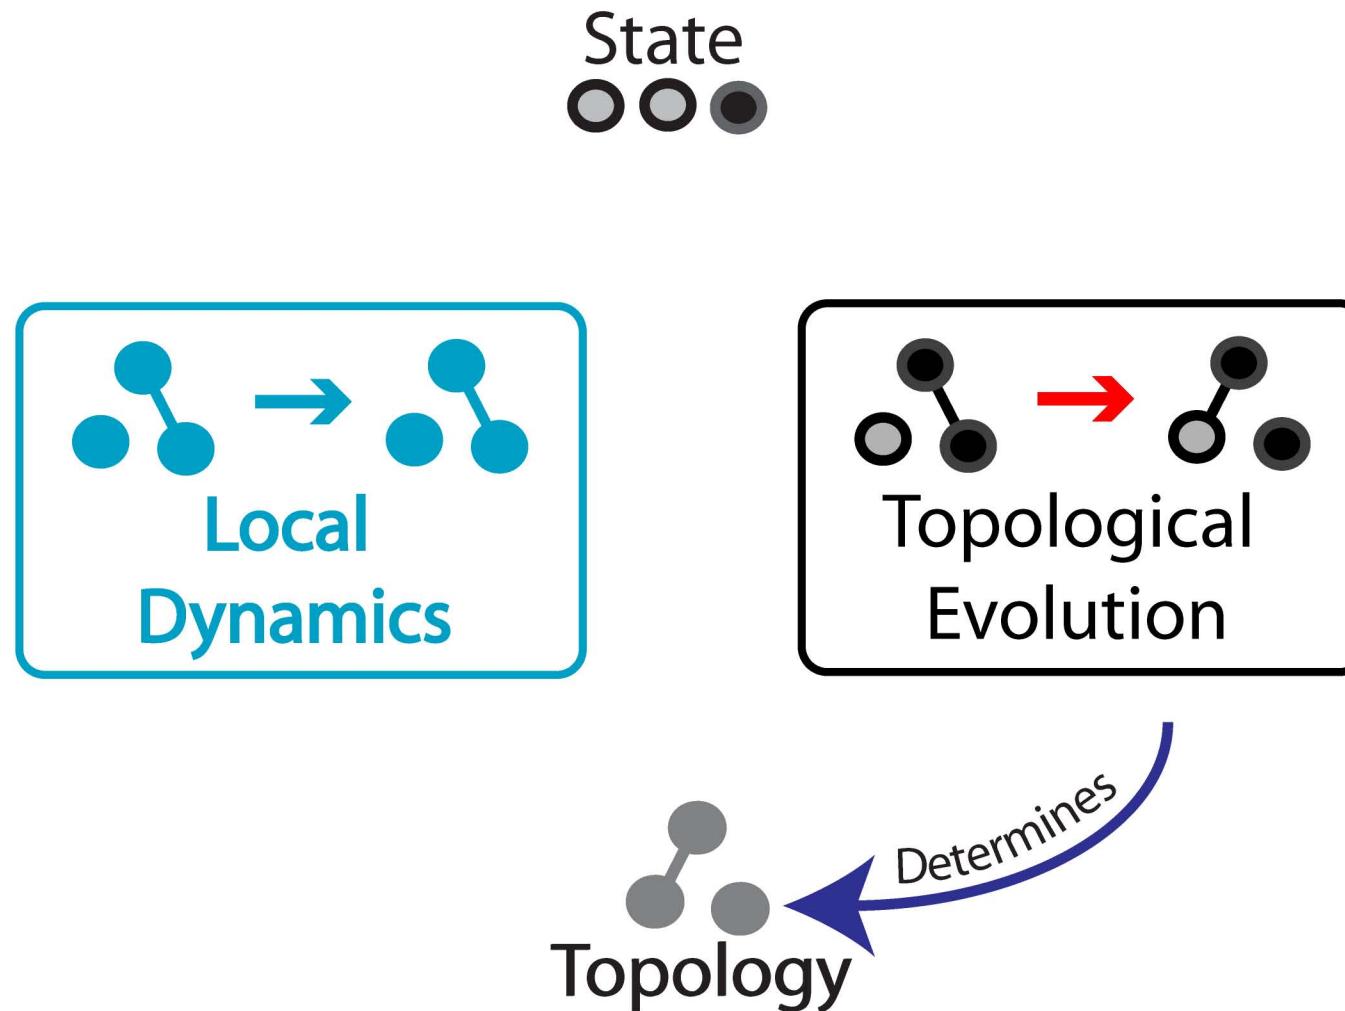

Dynamics **OF** Networks

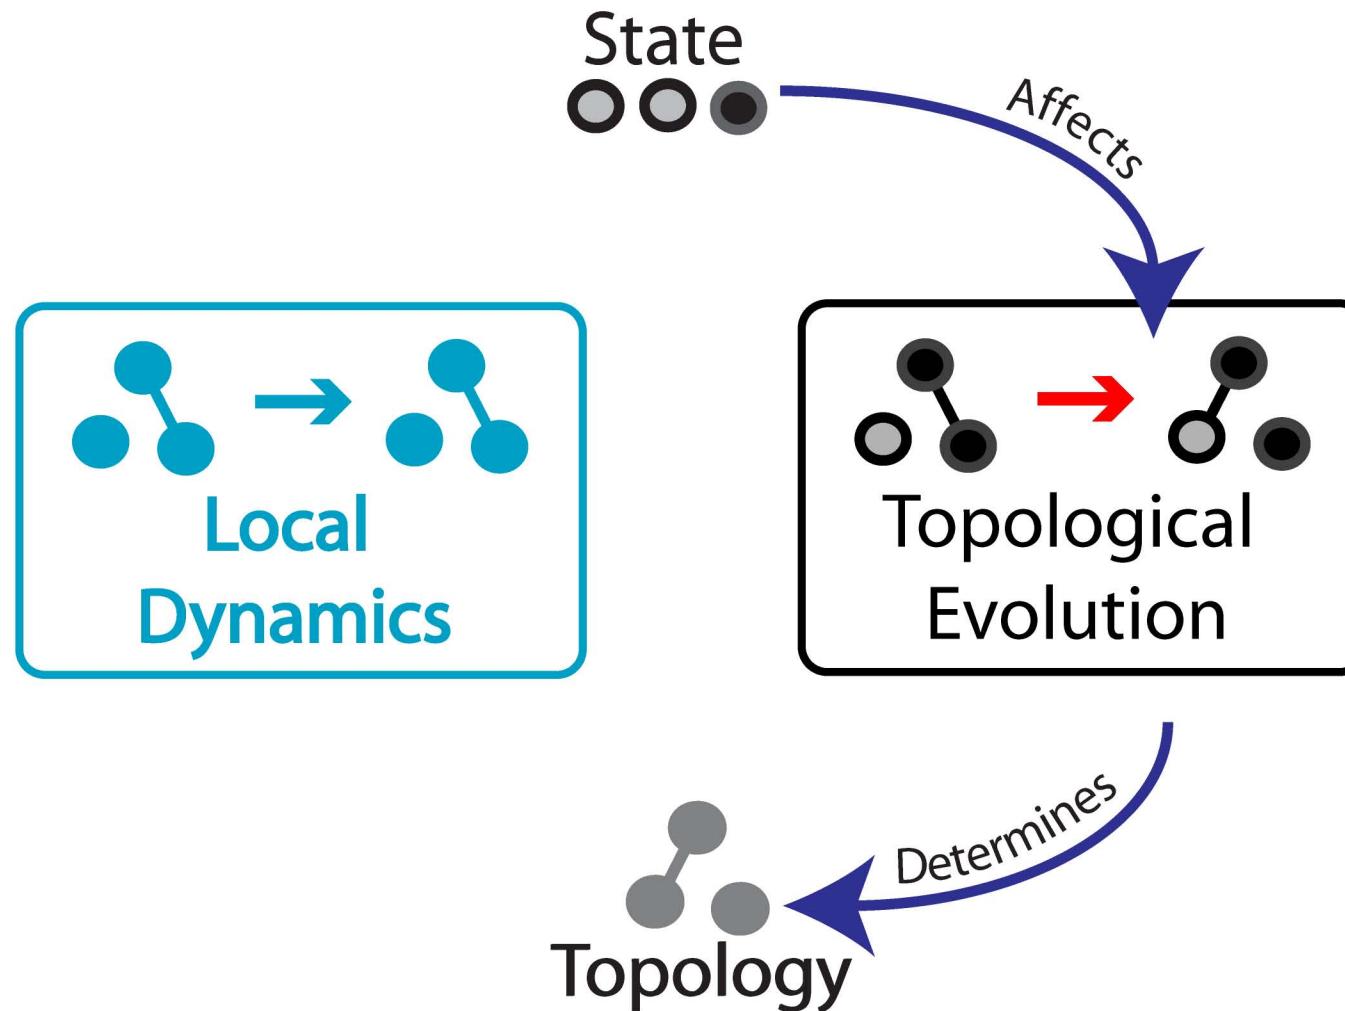

But: Local dynamics depends on topology

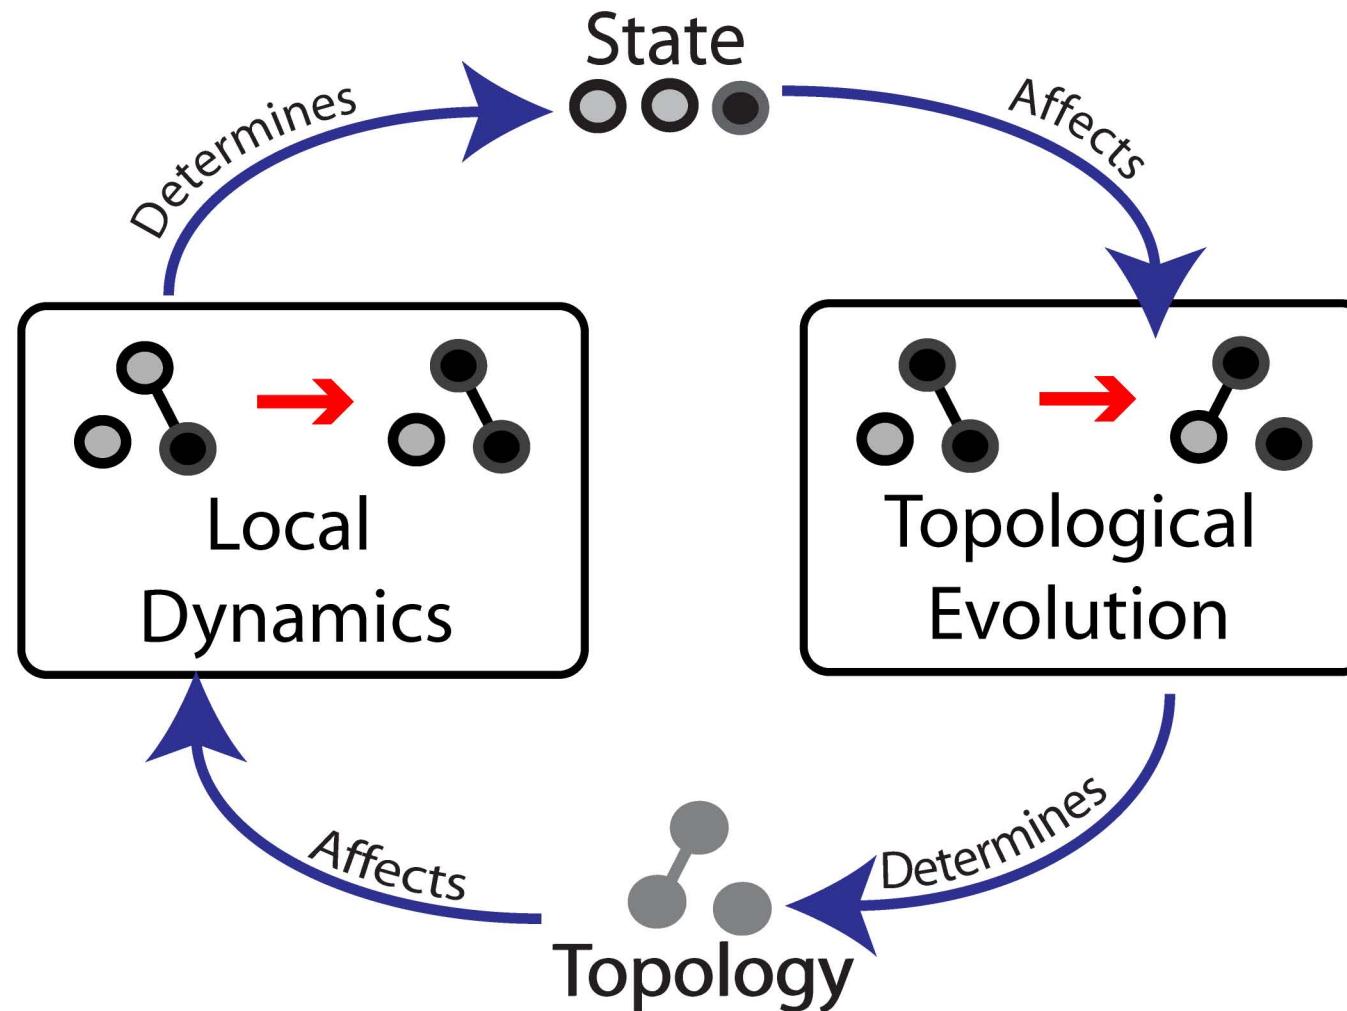

But: Topological Evolution determines topology.

But: Evolution can depend on the state.

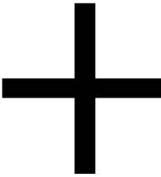

Adaptive Networks: dynamics ON and OF the net.

mpipks

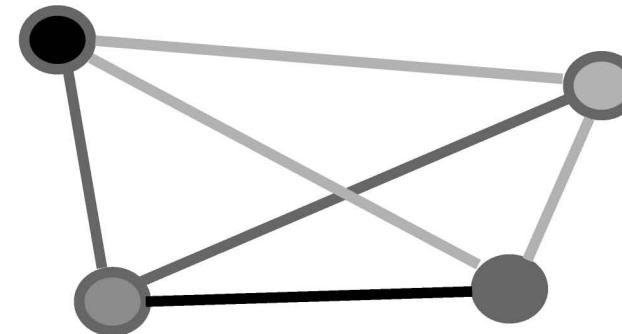

Adaptive Networks combine
topological evolution and local dynamics.

Local Dynamics  Topological Evolution  New Phenomena

Spontaneous division of labor

Ito and Kaneko, Phys. Rev. Lett. **88**, 028701-4 (2002)

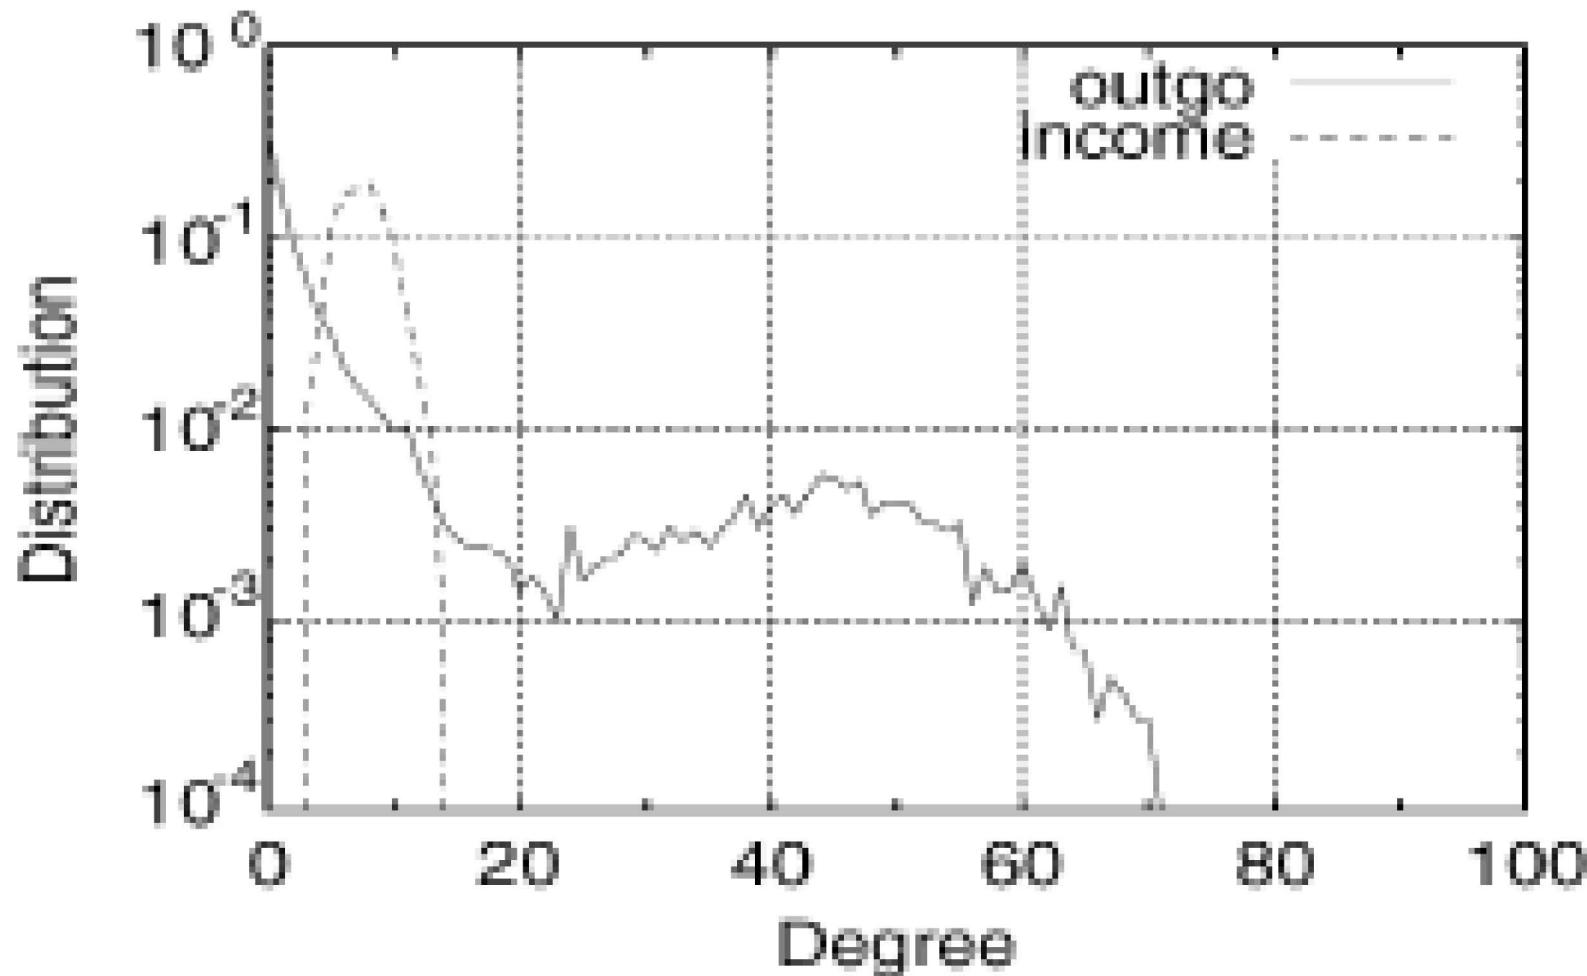

- Consider: ensemble of oscillators (maps)
- Coupling according to a given topology
- Link strength is a continuous variable (weighted network)

- Network is initially homogeneous
- **Like-and-Like Rule:** Coupling between nodes in similar states increases.
- But: Incoming coupling strength is normalized to one

Spontaneous division of labor

Ito and Kaneko, Phys. Rev. Lett. **88**, 028701-4 (2002)

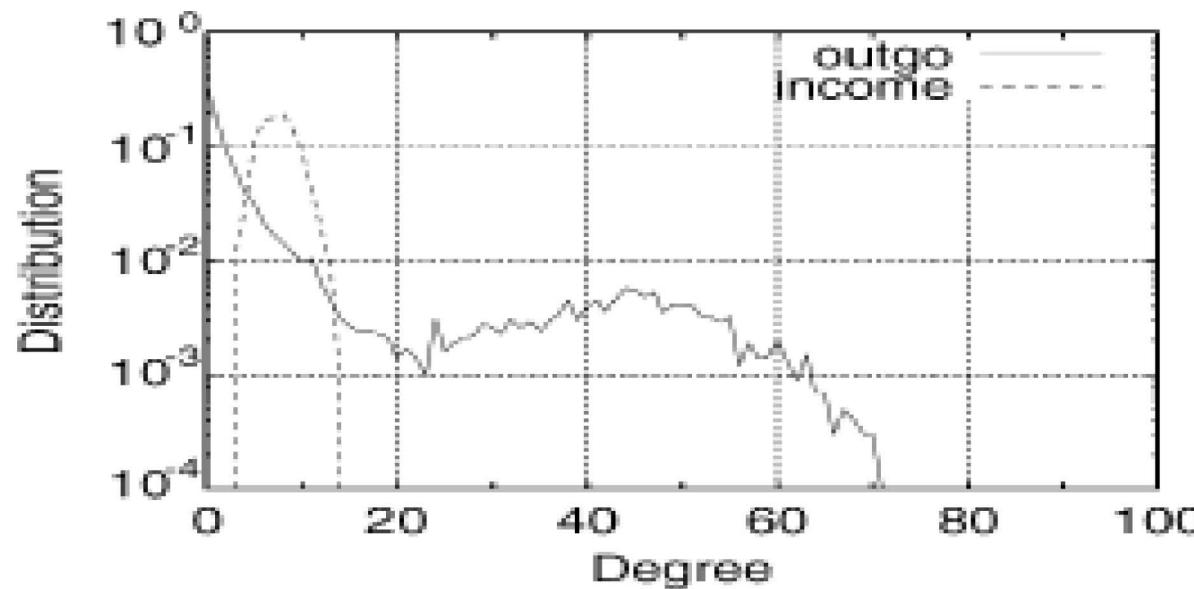

Spontaneous division of labor

Ito and Kaneko, Phys. Rev. Lett. **88**, 028701-4 (2002)

Leaders: Strong Impact on other nodes

Followers: Only very weak impact on other nodes

While the system never reaches a steady state
leaders remain leaders and followers remain followers
in the long-term behavior

(Player B)

Continuous Snowdrift Game

Ly Do
(Player A)

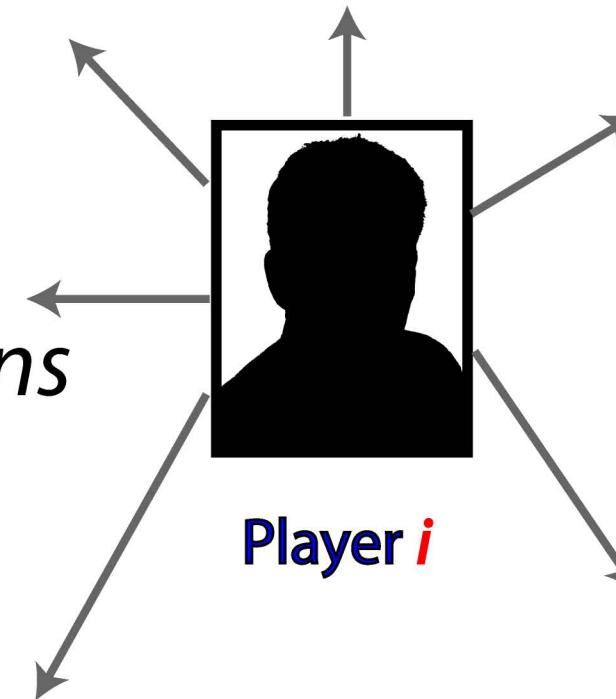

Thilo Gross
(Player B)

$$\text{Payoff A} = \text{Benefit}(e_A + e_B) - \text{Cost}(e_A)$$

Multi-Player Snowdrift Game

Now:

Many different Collaborations

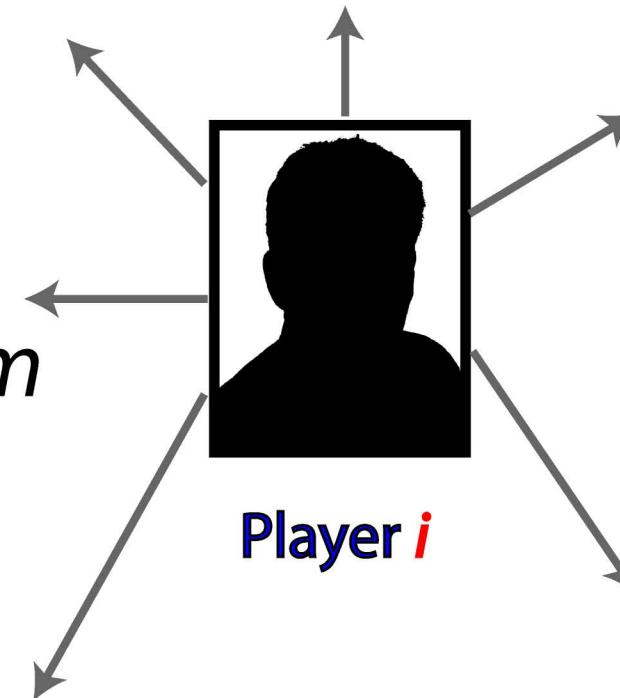

Player *i*

Multi-Player Snowdrift Game

Benefits add up.

*Cost is a function of the sum
of investments.*

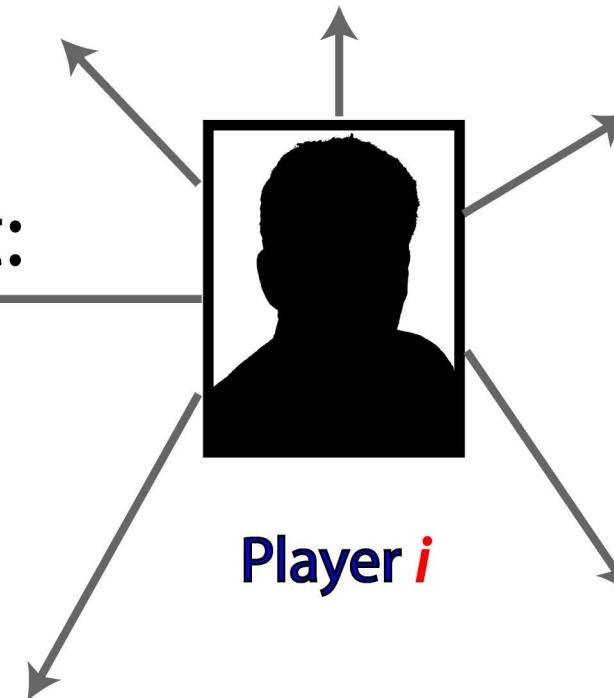

$$p_i = \left(\sum_j b (e_{ij} + e_{ji}) \right) - c \left(\sum_k e_{ik} \right)$$

Multi-Player Snowdrift Game

Payoff from one investment:

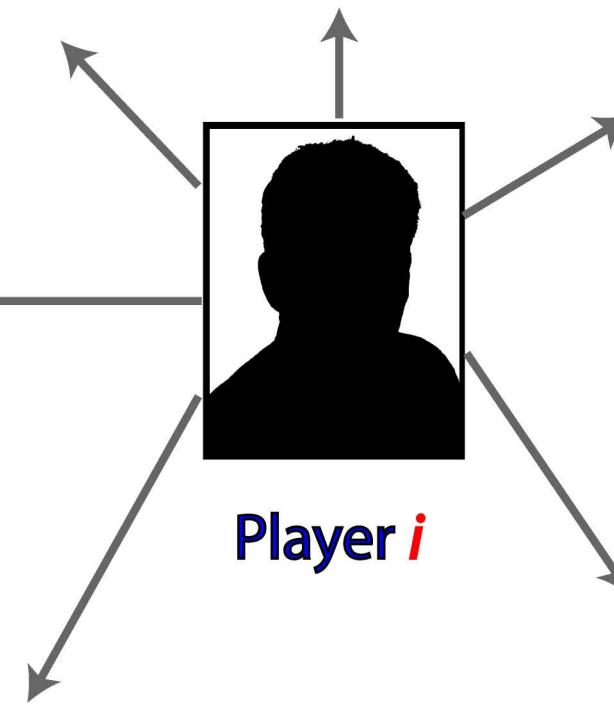

$$p_{ij} = b(e_{ij} + e_{ji}) - \frac{e_{ij}}{\sum_k e_{ik}} c \left(\sum_k e_{ik} \right)$$

Multiplayer Snowdrift Game

Evolutionary Optimization

$$\frac{\partial}{\partial t} e_{ij} = \frac{\partial}{\partial e_{ij}} \sum_{j \neq i} p_{ij}$$

(Players are selfish!)

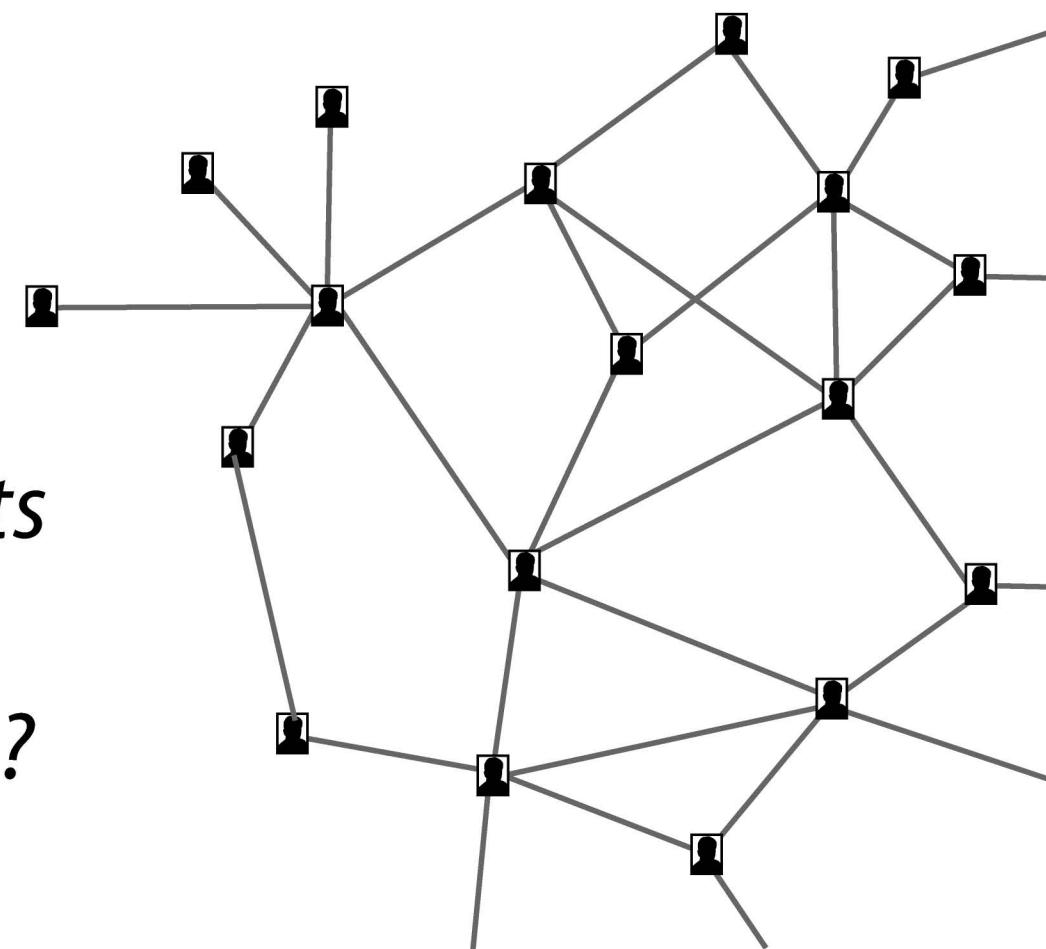

Multiplayer Snowdrift Game

Number of Players N

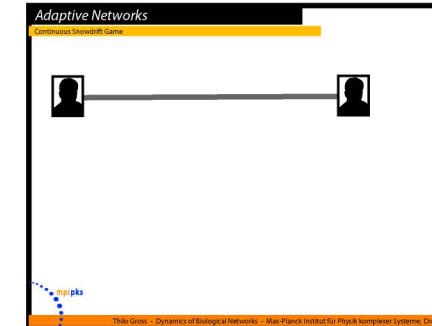

Number of Links $N(N-1)$

Initially:
All-to-all, equal investents

mpipks

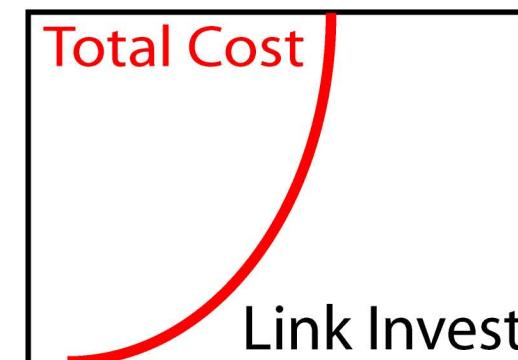

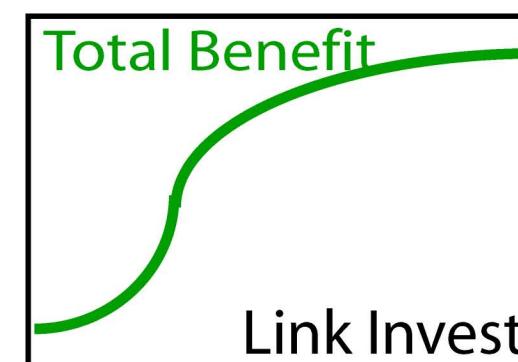

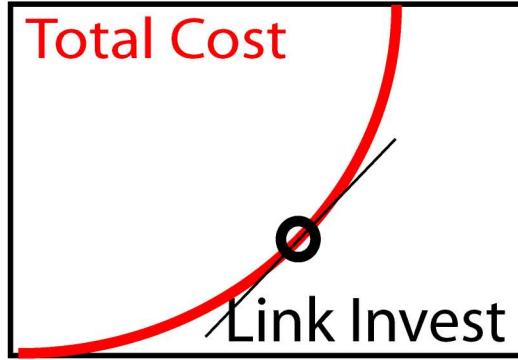

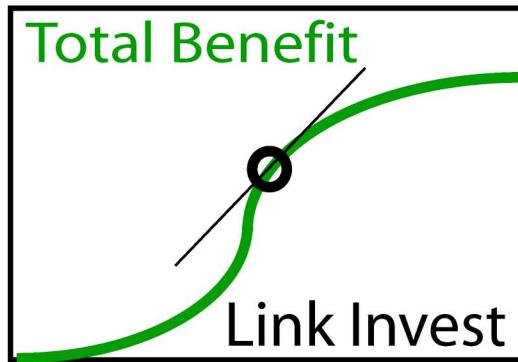

Consider a random link ...

Stationarity Implies:

Cost and **Benefit** have
identical slopes

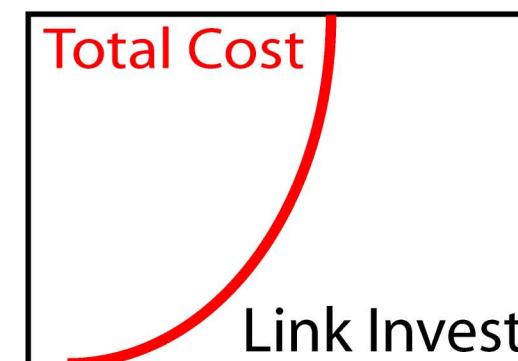

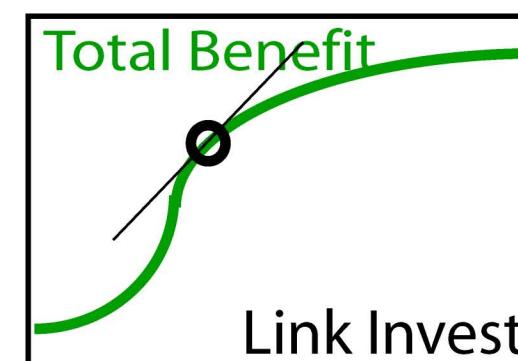

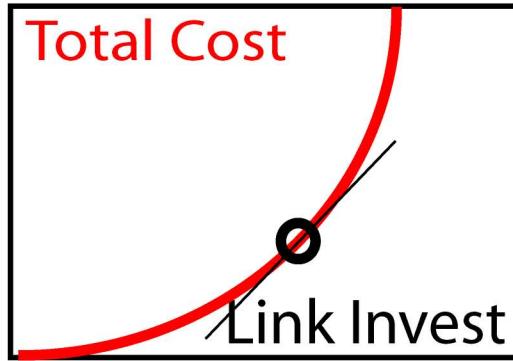

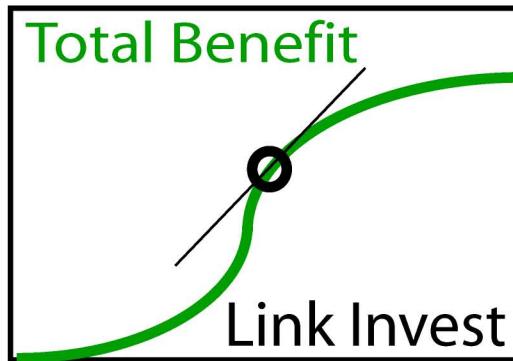

Consider a random link ...

Consider a random link ...

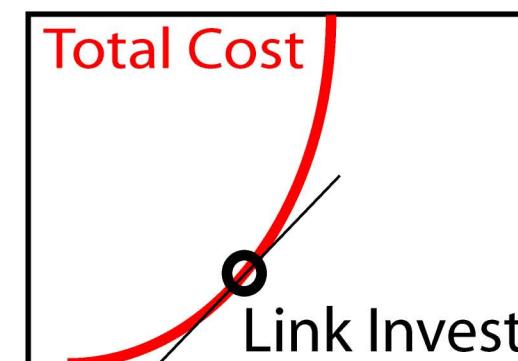

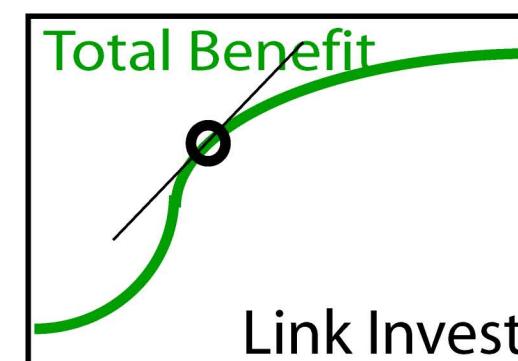

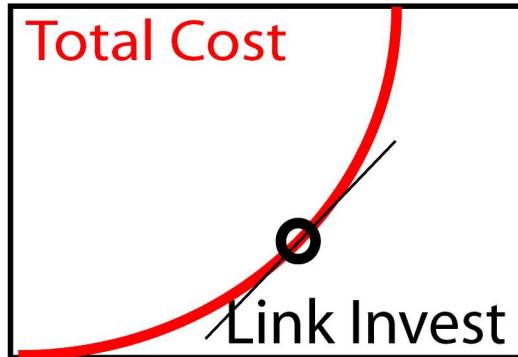

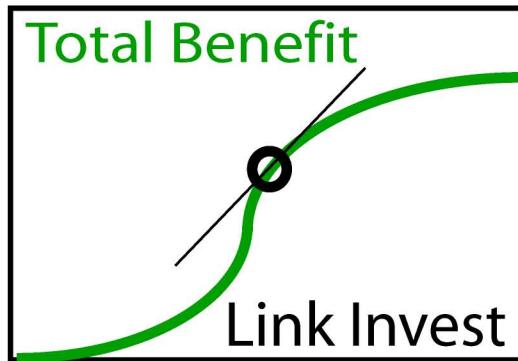

Benefit(Invest1 + Invest 2)

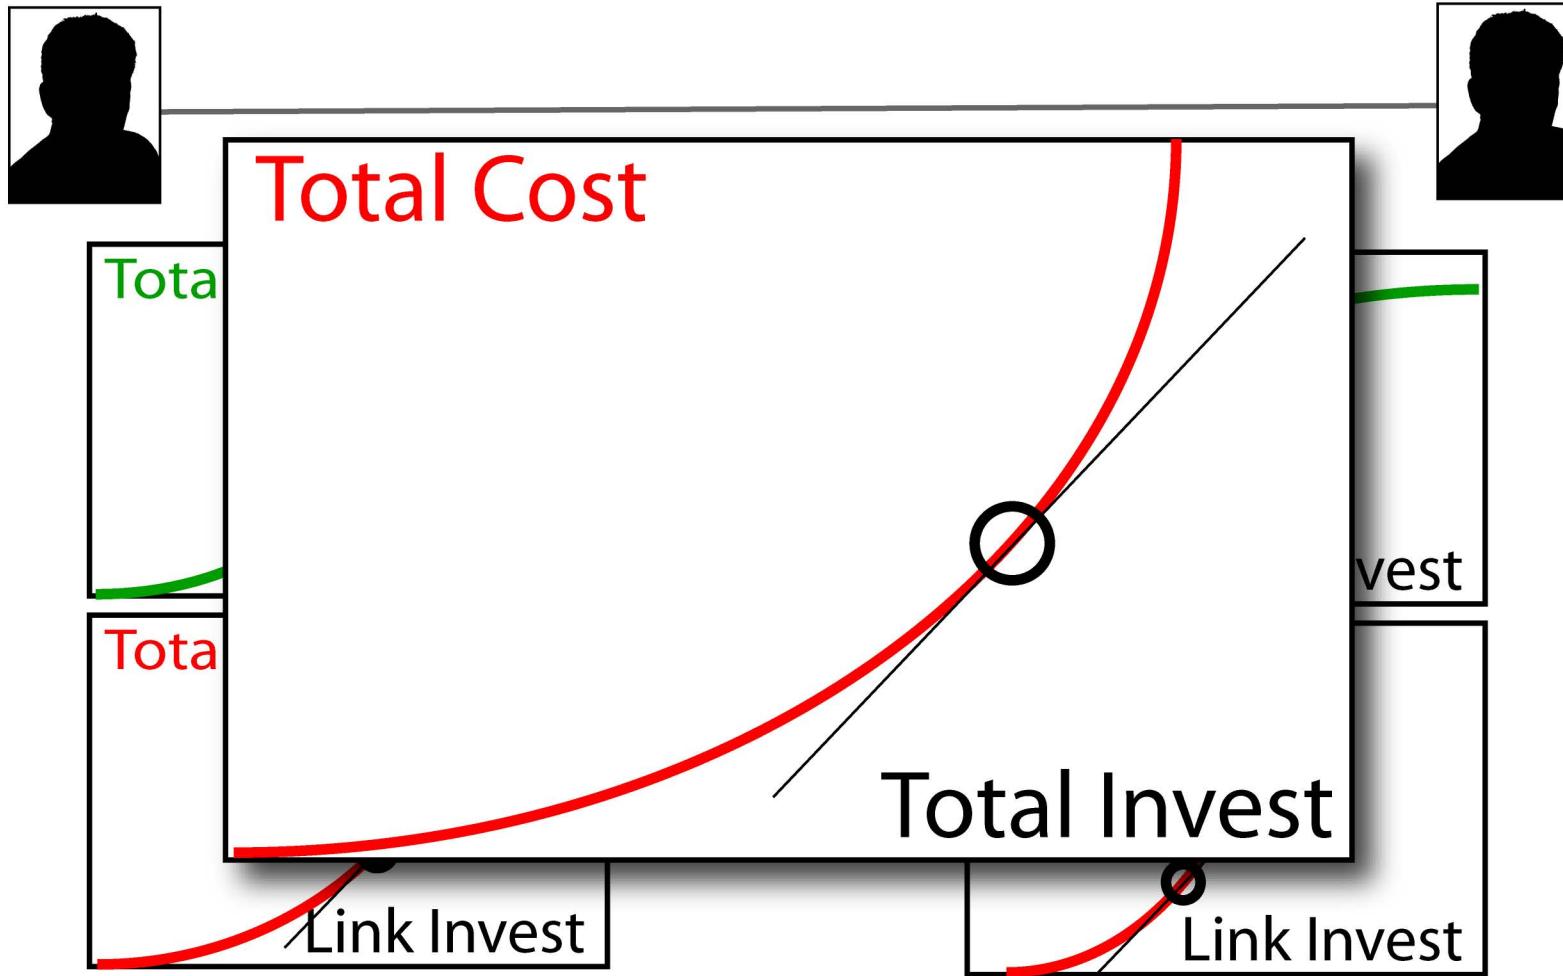

Consider a random link ...

Benefit(Invest1 + Invest 2)

Consider a random link ...

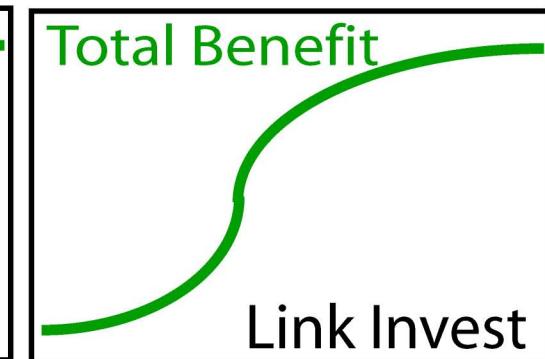

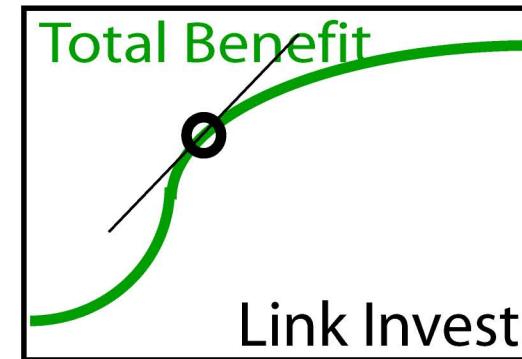

This Implies: Equal Total Investment

Consider a random player ...

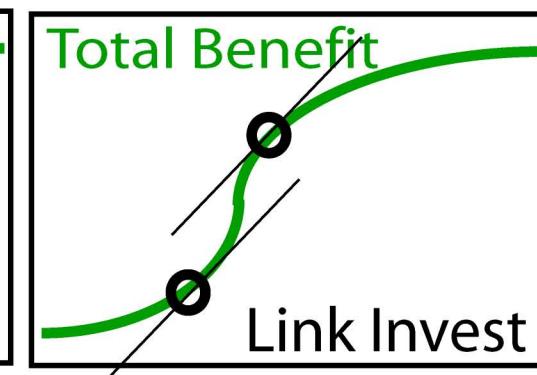

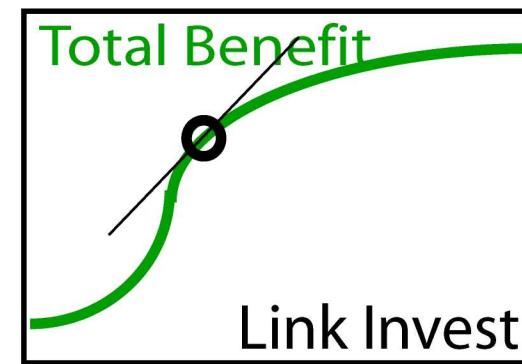

What about the investment in another Link?

Consider a random player ...

What about the investment in another Link?

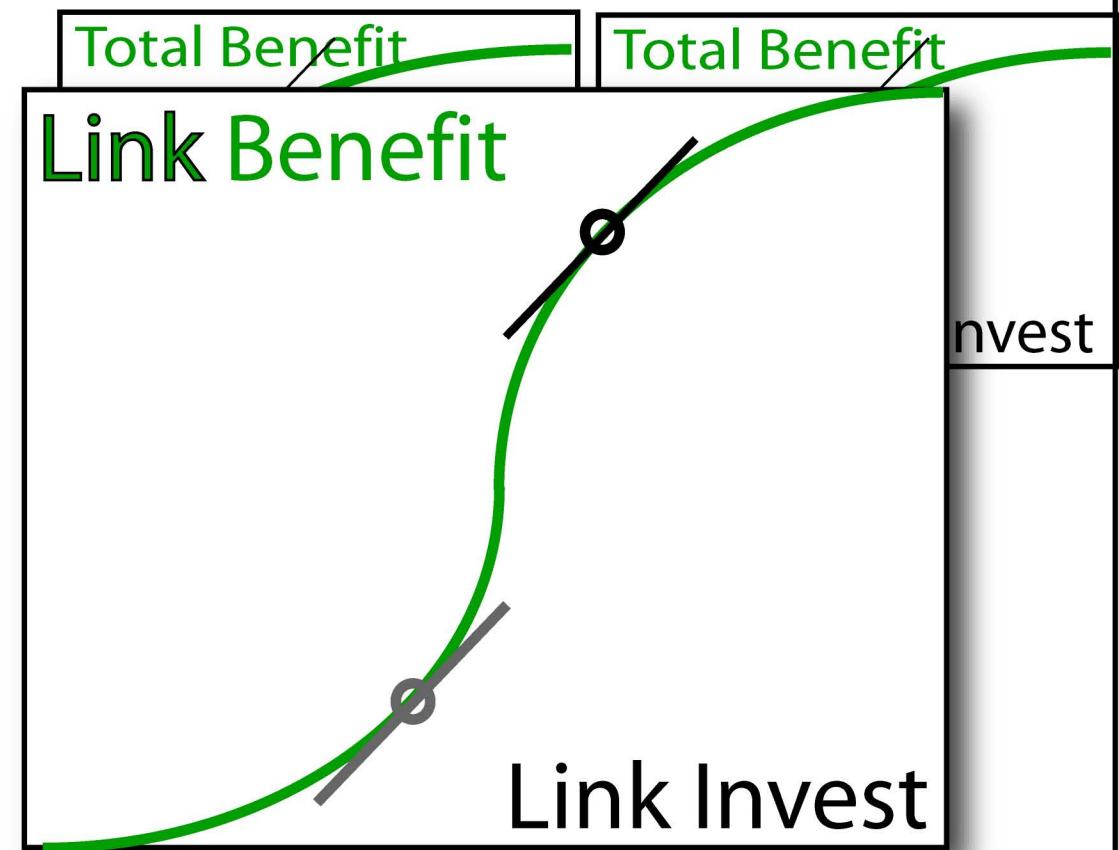

Stationarity implies:
Identical slope of benefit curve

Consider a random player ...

For sigmoidal
Functions:

Same slope implies
one of two possible
link benefits

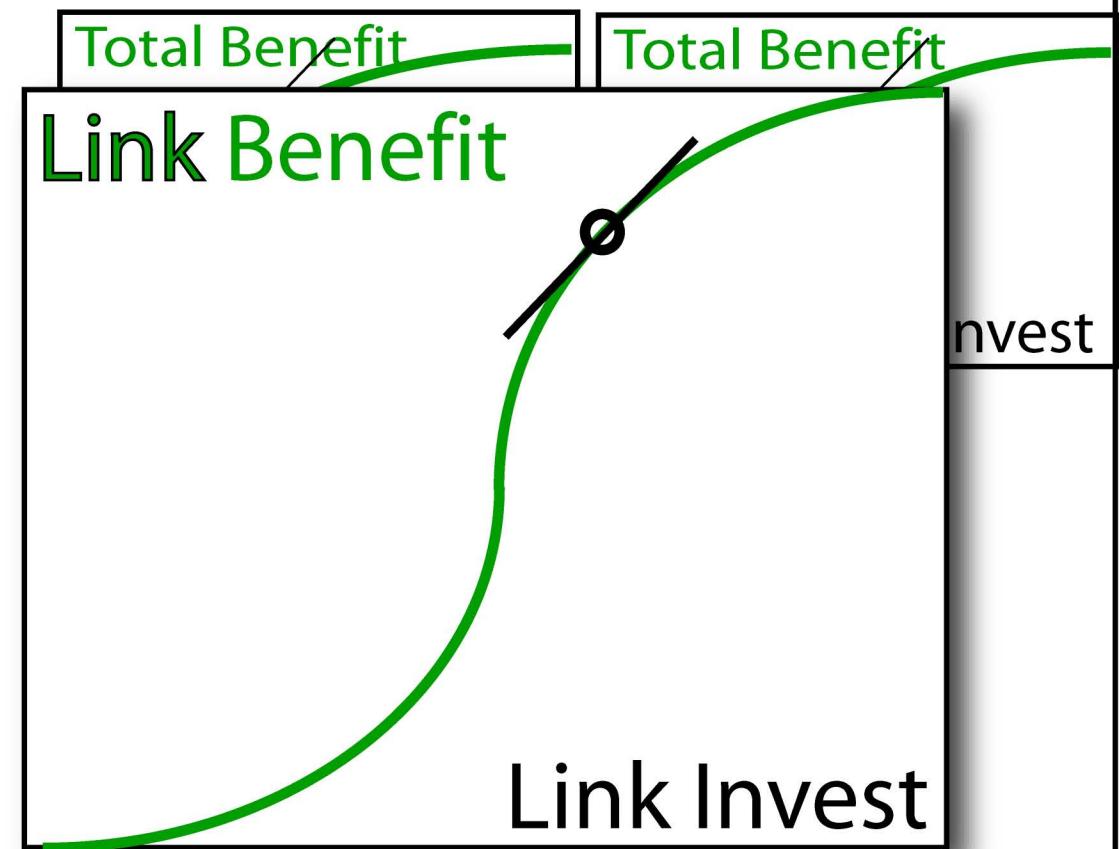

mpipks

Consider a random player ...

For sigmoidal
Functions:

One turns out to be
dynamically unstable

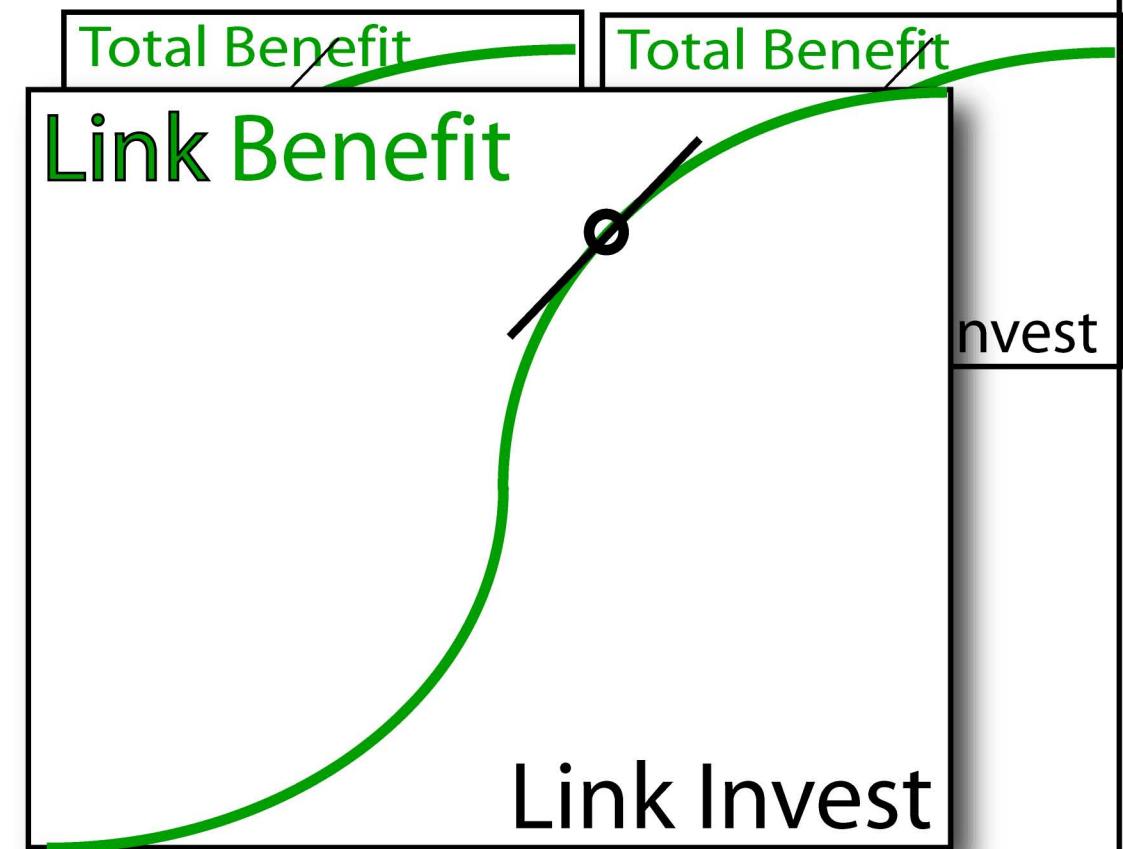

Consider a random player ...

For sigmoidal
Functions:

All Links produce the
same benefit

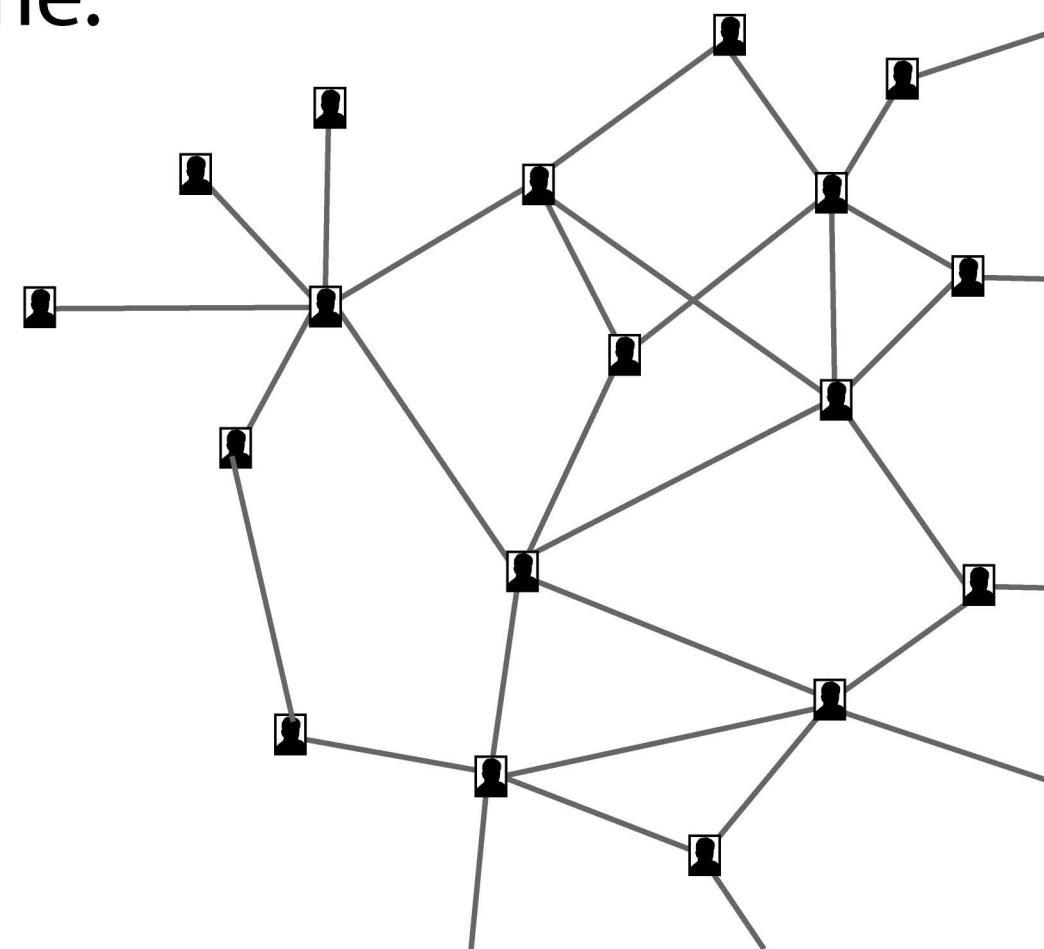

In a connected component ...

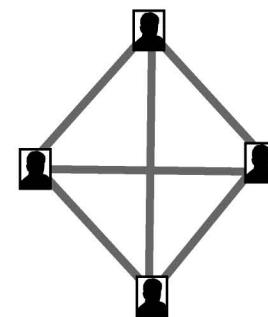

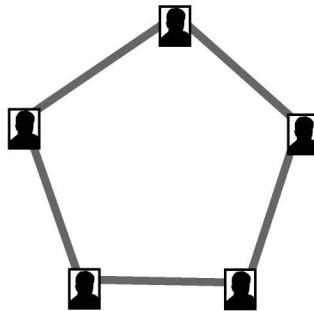

All players invest the same.

All links produce the same benefit.

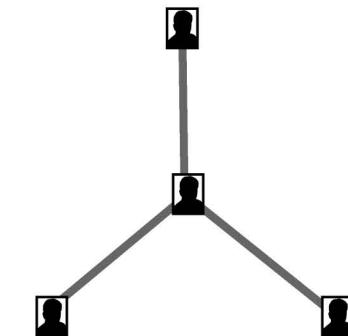

Is this fair ?

Fairness depends on topology

Fair Topologies

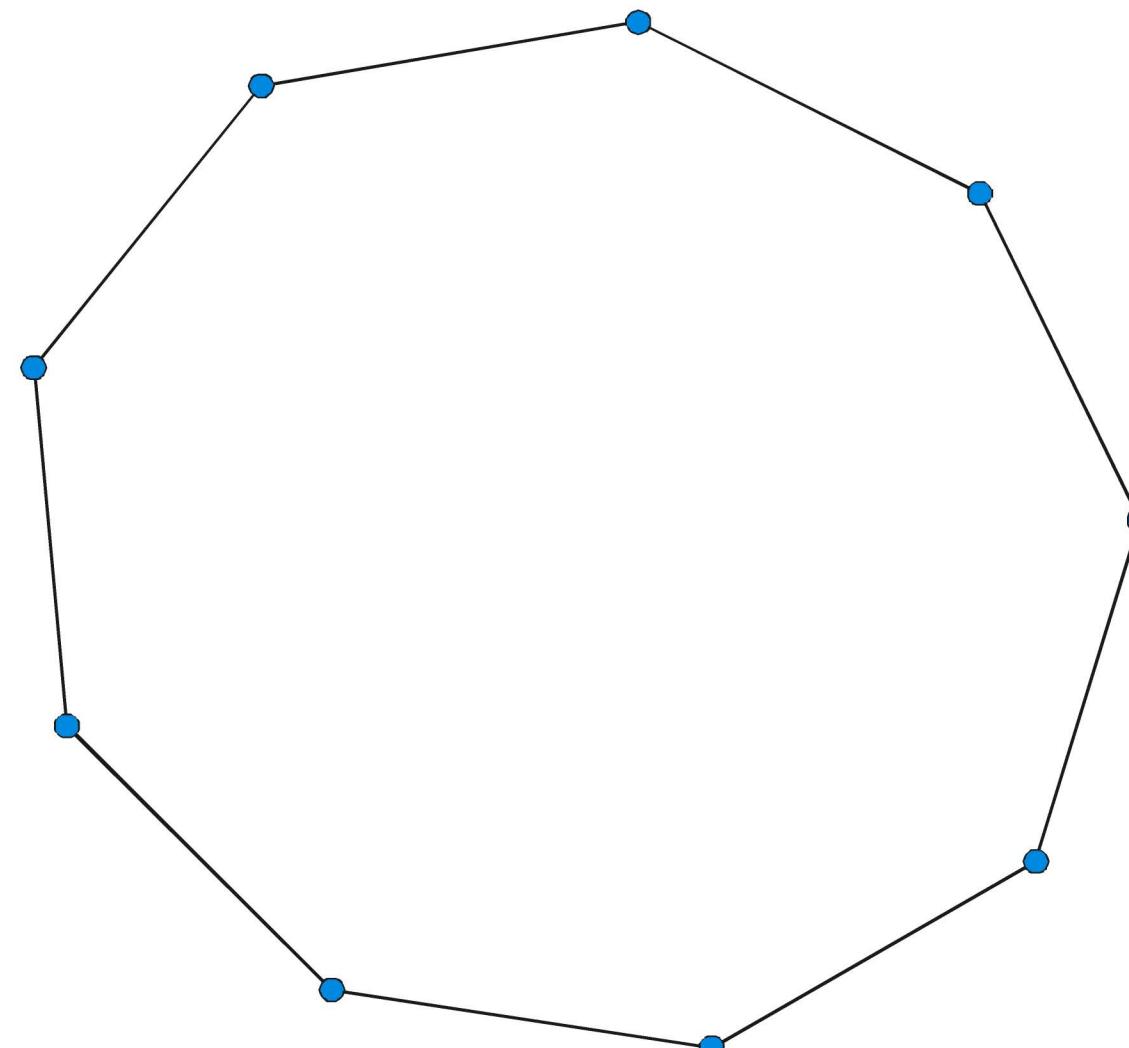

Unfair Topology

Why are links broken?

$$\frac{\text{Investment per Link}}{\text{Investment per Node}} = \frac{\text{Number of Nodes in Component}}{\text{Number of Links in Component}}$$

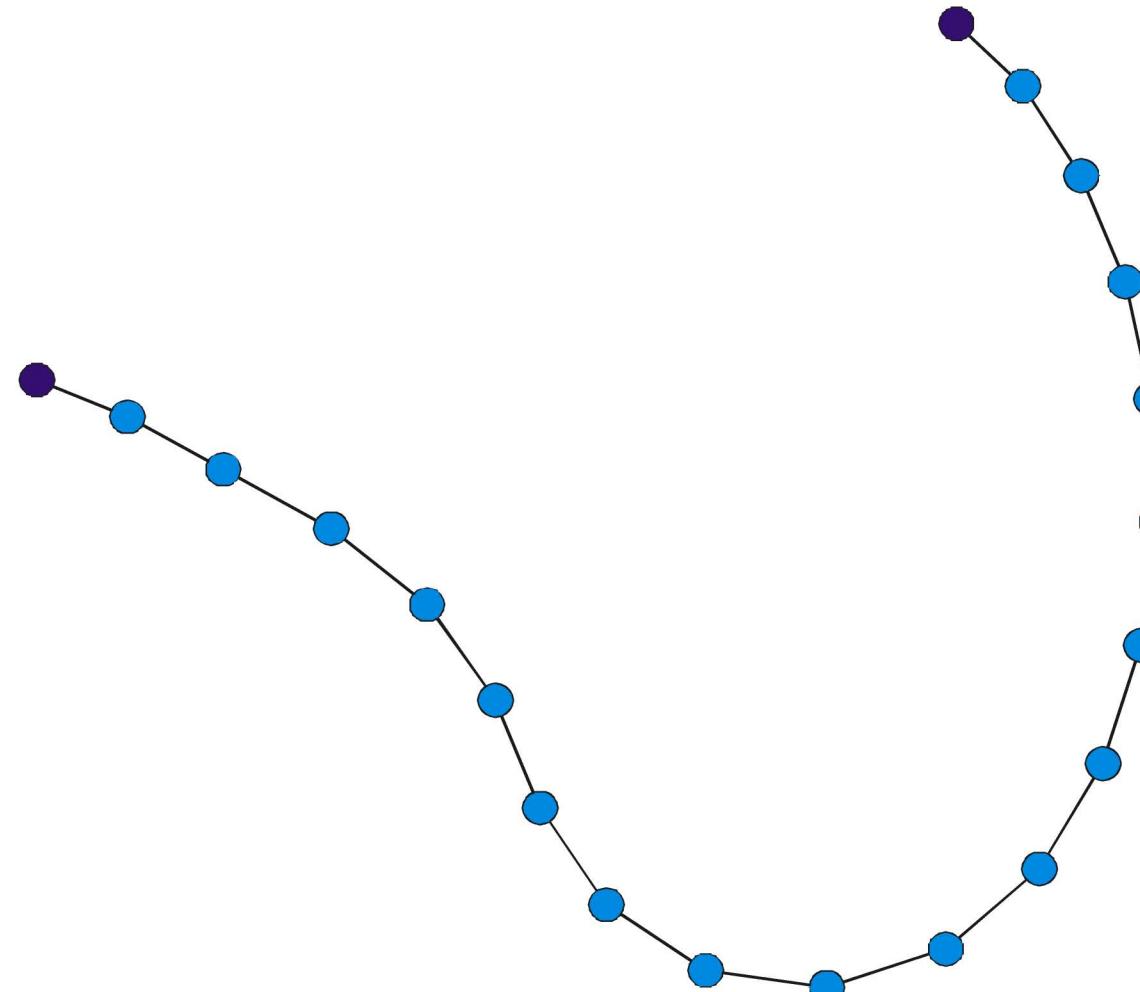

Cost and Benefit functions determine
the **average degree** of the nodes
(but not uniquely)

Results: $N = 9$

Results: $N = 20$

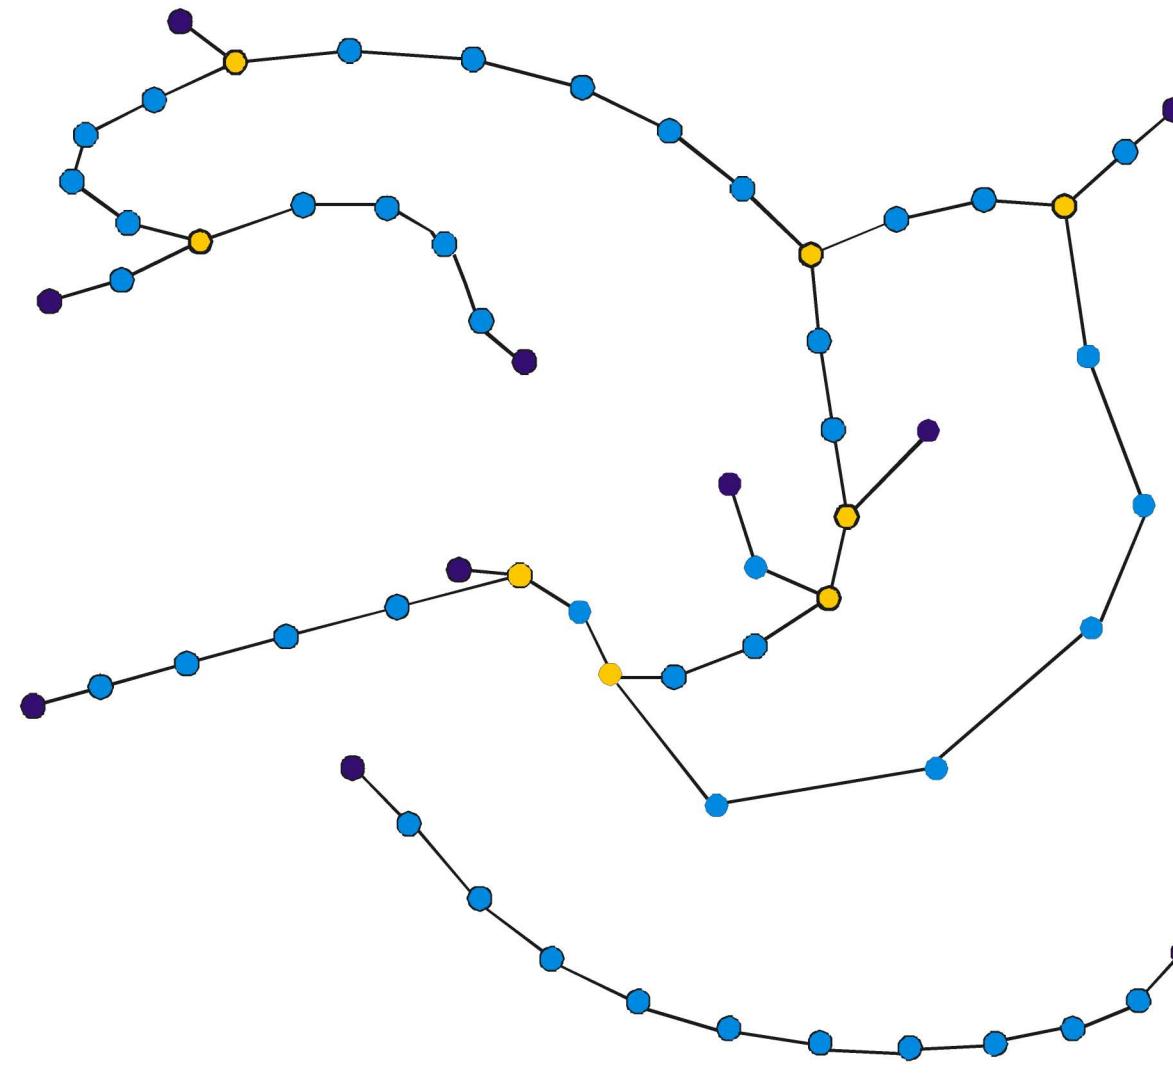

mpipks

Results: N = 40

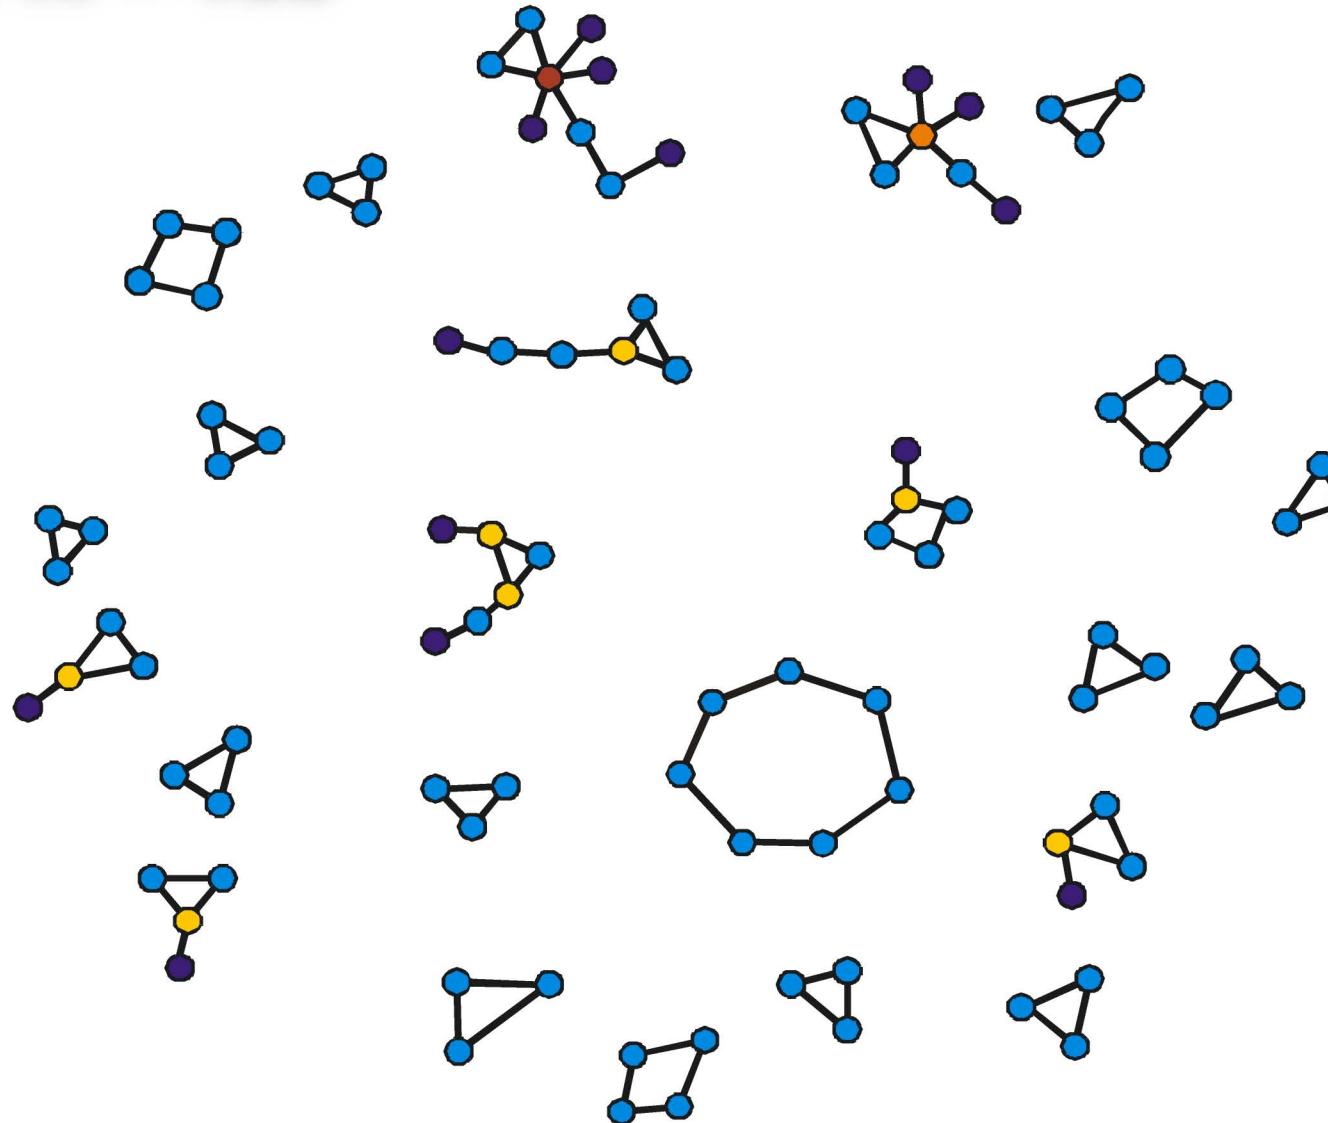

mpipks

Results: $N = 60$

mpipks

Results: $N = 100$

mpipks

Results: Summary

- Same total investment per link.
- Same total investment per node.
- (Almost) right mean degree.
- Topologies are mostly fair.

Results: Summary

- Same total investment per link.
- Same total investment per node.
- (Almost) right mean degree.
- Topologies are mostly fair.

No Leaders? No Followers?

The adaptive Snowdrift game

So far ...

- ... only topological dynamics.
- ... no “internal” degrees of freedom.
- ... not really an adaptive network.

The adaptive Snowdrift game

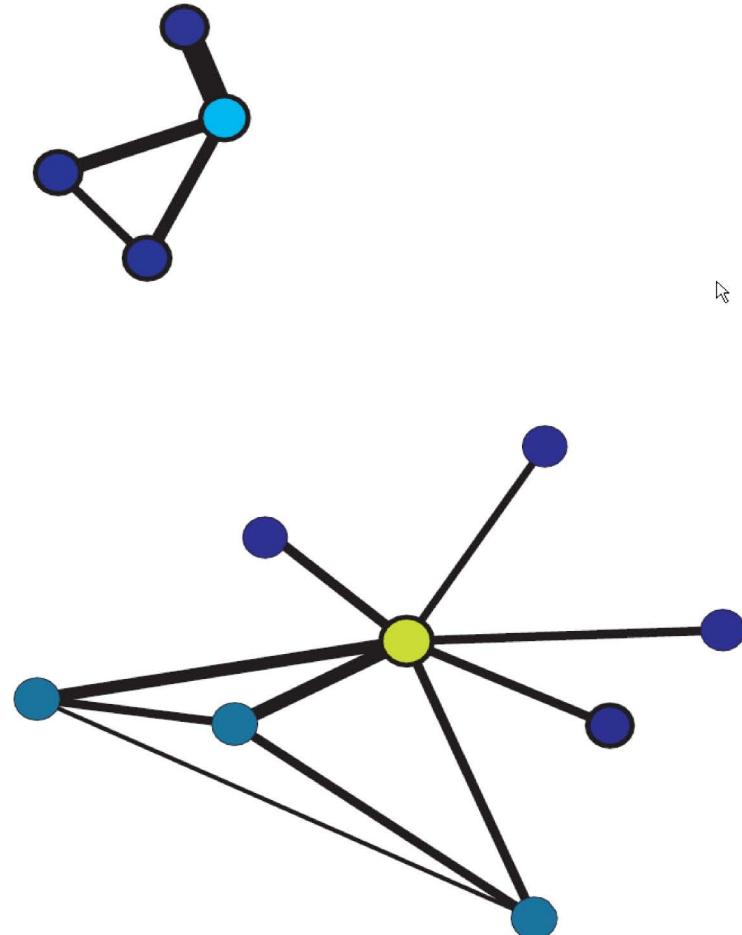

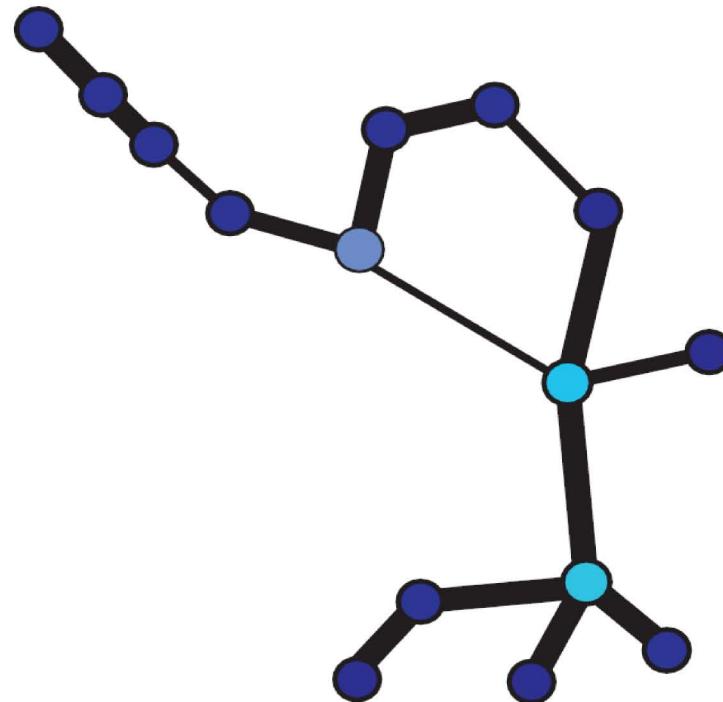

So far ...

- ... only topological dynamics.
- ... no “internal” degrees of freedom.
- ... not really an adaptive network.

Now ...

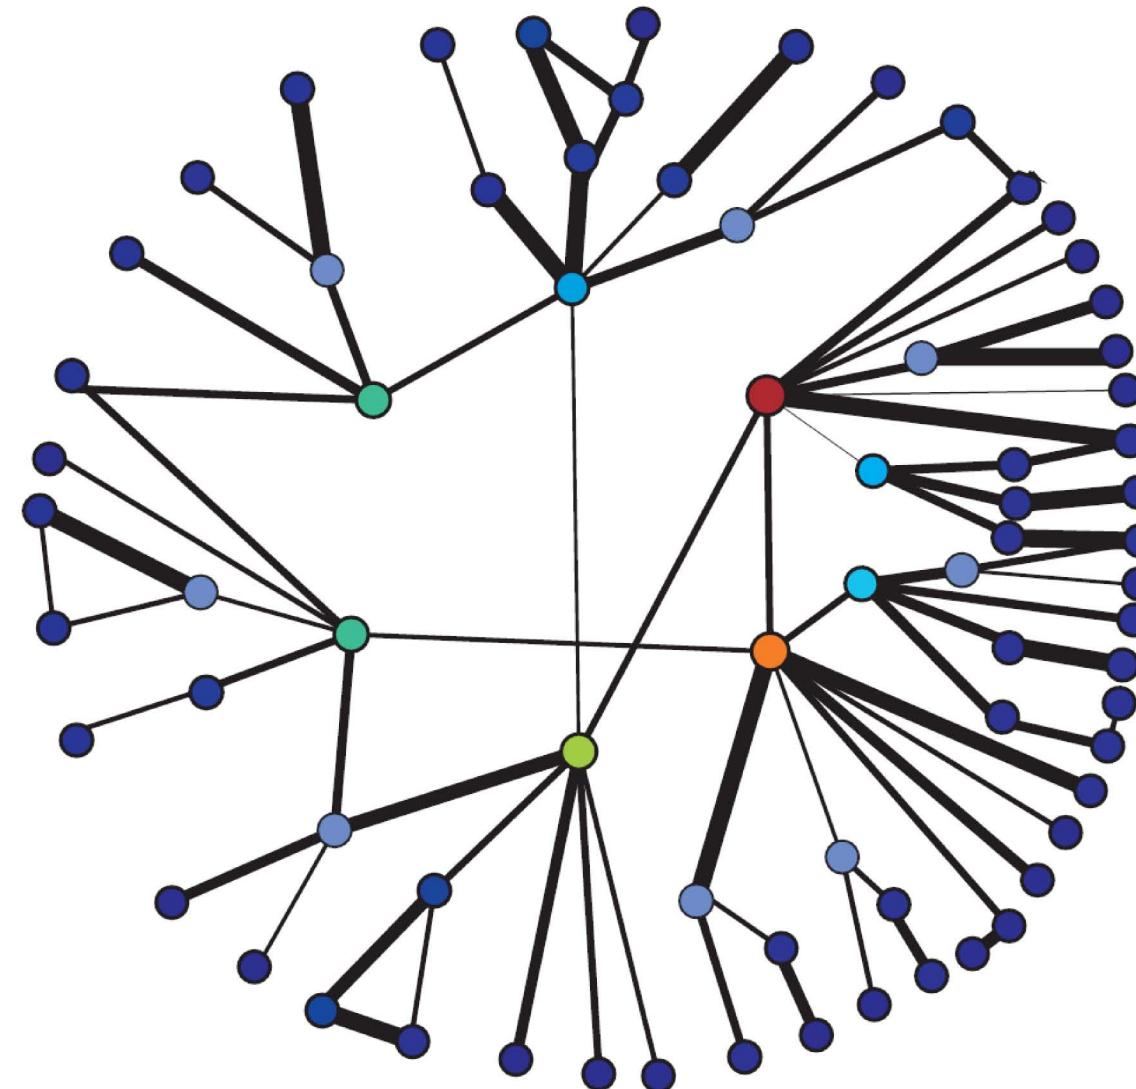

- ... investment becomes cheaper for successful players.

The adaptive Snowdrift game

mpipks

The adaptive Snowdrift game

mpipks

Conclusion

The snowdrift game generates **relatively fair topologies** in which **everybody** invests **the same** and every link generates the **same benefit**.

Internal degrees of freedom turn the model into an **adaptive network**. It builds-up **complex structures** at the cost of fairness.

*Thank you very much
for your attention*
