#### Important Applications

- Aerodynamics: Shape optimization to improve airplanes, cars, ventilators, turbines...
- Hydrodynamics: wave drag of boats, pipes, by-pass, harbors...

- Electromagnetics: Stealth airplane, antenna, missiles...
- Combustion: Car and airplane engines, scramjets...
- Turbulence: delay the separation of boundary layers, reduce turbulent drag (active control, deformable airplane...)

### Important Applications

- Aerodynamics: Shape optimization to improve airplanes, cars, ventilators, turbines...
- Hydrodynamics: wave drag of boats, pipes, by-pass, harbors...

- Electromagnetics: Stealth airplane, antenna, missiles...
- Combustion: Car and airplane engines, scramjets...
- Turbulence: delay the separation of boundary layers, reduce turbulent drag (active control, deformable airplane...)

#### Main Topics for Shape Optimization

 $\min_{v\in V\subset \mathcal{R}^d} E(v)$ 

- Black Box Optimization: use only  $v \rightarrow E(v)$
- Differentiable Optimization: use also  $\operatorname{grad}_{v} E(v)$

$$E(\mathbf{v} + \delta \mathbf{v}) = E(\mathbf{v}) + \langle \operatorname{grad} E(\mathbf{v}), \delta \mathbf{v} \rangle + o(\|\delta \mathbf{v}\|)$$
  
$$\delta \mathbf{v} = -\rho \operatorname{grad} E(\mathbf{v}) \Rightarrow E(\mathbf{v} + \delta \mathbf{v}) - E(\mathbf{v}) \approx -\rho \|\operatorname{grad} E(\mathbf{v})\|^2$$

- Constrained Optimization:  $V = \{v \in H : f(v) = 0, g(v) \le 0\}$
- Multi-criteria and Pareto optimality:

$$\boldsymbol{E}(\boldsymbol{v}) = \sum_{i} \alpha_{i} \boldsymbol{E}_{i}(\boldsymbol{v}) \iff ? \nexists \boldsymbol{w} : \boldsymbol{E}_{i}(\boldsymbol{w}) \leq \boldsymbol{E}_{i}(\boldsymbol{v}) \forall i$$

• Topological Optimization: Embed the problem into a larger class

#### An Academic Problem

$$\min_{\mathbf{S}\in\mathcal{S}_d} \{ \int_D |\psi - \psi_d|^2 : -\Delta \psi = 0, \text{ in } \mathbf{C} - \dot{\mathbf{S}}, \quad \psi|_{\mathbf{S}} = 0 \ \psi|_{\partial \mathbf{C}} = \psi_d \}$$

Wind tunnel Design by adapting S so that flow is uniform in D. Flow is irrotational inviscid and 2D.

### Existence of Solution

#### Theorem

## $\min_{v\in V\subset \mathcal{R}^d} E(v)$

has a solution if *V* is closed, *E* is bounded from below, l.s.c. and either *V* is bounded or  $\lim_{||x||\to\infty} E(x) = +\infty$ 

Thus if one can show that the criteria of the OSD problem is l.s.c. a solution will exist. It has been shown by Sverak that this is so if the number of connected component of  $\Omega$  is bounded.

In Allaire, Bucur, Delfour et al, it is shown that a penalization of the perimeter of the unknown surface also induce existence in 2D.

**Theorem** The following problem has at least one solution:

 $\min_{\mathbf{S}\in\mathcal{S}_d} \{ \int_D |\psi - \psi_d|^2 + \epsilon |\mathbf{S}|^2 : -\Delta \psi = 0, \text{ in } C - \dot{\mathbf{S}}, \quad \psi|_{\mathbf{S}} = 0 \quad \psi|_{\partial C} = \psi_d \}$ Uniqueness is almost impossible to prove;

### Existence of Solution

#### Theorem

## $\min_{v\in V\subset \mathcal{R}^d} E(v)$

has a solution if *V* is closed, *E* is bounded from below, I.s.c. and either *V* is bounded or  $\lim_{||x||\to\infty} E(x) = +\infty$ Thus if one can show that the criteria of the OSD problem is I.s.c. a solution will exist. It has been shown by Sverak that this is so if the number of connected component of  $\Omega$  is bounded.

In Allaire, Bucur, Delfour et al, it is shown that a penalization of the perimeter of the unknown surface also induce existence in 2D.

Theorem The following problem has at least one solution:

 $\min_{\mathbf{S}\in\mathcal{S}_d} \{ \int_D |\psi - \psi_d|^2 + \epsilon |\mathbf{S}|^2 : -\Delta \psi = 0, \text{ in } \mathbf{C} - \dot{\mathbf{S}}, \quad \psi|_{\mathbf{S}} = 0 \quad \psi|_{\partial C} = \psi_d \}$ Uniqueness is almost impossible to prove;  $-\Delta\psi^{\epsilon} = f \text{ in } \Omega^{\epsilon} \qquad \psi^{\epsilon} = 0 \text{ on } \Gamma^{\epsilon} := \{x + \epsilon\alpha n : x \in \Gamma\}$ 

Definition If  $\psi'_{\alpha} := \lim \frac{1}{\epsilon} (\psi^{\epsilon} - \psi)$  exists then  $\psi$  is Gateau differentiable with respect to  $\Gamma$  in the direction  $\alpha$ . If  $\psi'_{\alpha}$  is linear in  $\alpha$  then  $\psi$  is Frechet differentiable. Similarly

Х

8/5

$$\psi^{\epsilon\alpha} = \psi + \epsilon \psi'_{\alpha} + \frac{\epsilon^2}{2} \psi'_{\alpha}$$

To compute  $\psi'$  and  $\psi''$  notice that, by linearity, they satisfy the same PDE but with f = 0. By Taylor expansion,  $x \in \Gamma$ :

$$0 = \psi^{\epsilon \alpha}(x + \epsilon \alpha n) = \psi^{\epsilon \alpha}(x) + \epsilon \alpha \frac{\partial \psi^{\epsilon \alpha}}{\partial n}(x) + \frac{\epsilon^2 \alpha^2}{2} \frac{\partial^2 \psi}{\partial n^2}(x) + \dots$$

Therefore

$$-\Delta\psi'_{\alpha} = 0 \quad \psi'_{\alpha}|_{\Gamma} = -\alpha \frac{\partial\psi}{\partial n}, \qquad -\Delta\psi''_{\alpha} = 0 \quad \psi''_{\alpha}|_{\Gamma} = -\alpha \frac{\partial\psi'_{\alpha}}{\partial n} - \frac{\alpha^2}{2} \frac{\partial^2\psi}{\partial n^2 \psi}$$

### **Optimality Conditions**

Consider the Wind Tunnel Problem with  $S^{\epsilon} = \{x + \epsilon \alpha n : x \in S\}$ . Think of the PDE as the implicit definition of  $S \rightarrow \psi(S)$ . Then J() is a function of S only:

$$J(S^{\epsilon}) = \int_{D} |\psi^{\epsilon} - \psi_{d}|^{2} = \int_{D} |\psi - \psi_{d}|^{2} + 2\epsilon \int_{D} (\psi^{\epsilon} - \psi_{d})\psi_{\alpha}' + o(\epsilon)$$

with  $\Delta \psi'_{\alpha} = 0$ ,  $\psi'_{\alpha}|_{S} = -\alpha \frac{\partial \psi}{\partial n}$ ,  $\psi'_{\alpha}|_{\Gamma-S} = 0$ . If *J* is Frechet differentiable there exists  $\xi$  such that  $J'_{\alpha} = \int_{S} \xi \alpha$ . To find  $\xi$  we must use the adjoint trick and introduce

$$-\Delta oldsymbol{
ho}=(\psi^{\epsilon}-\psi_{d})I_{D}, \ oldsymbol{
ho}|_{\Gamma}=0$$

Then

$$2\int_{D}(\psi^{\epsilon} - \psi_{d})\psi_{\alpha}' = -2\int_{\Omega}\psi_{\alpha}'\Delta p = -2\int_{\Omega}\Delta\psi_{\alpha}'p + \int_{\Gamma}(\frac{\partial p}{\partial n}\psi_{\alpha}' + \frac{\partial\psi_{\alpha}'}{\partial n}p)$$
  
Corollary 
$$J_{\alpha}' = 2\int_{\Omega}\frac{\partial p}{\partial n}\frac{\partial\psi}{\partial n}\alpha$$

### **Conceptual Algorithm**

- 0. Choose a shape  $S^0$ , a small number  $\rho > 0$  and set m=0.
- 1. Compute  $\psi^m$  and  $p^m$  by solving

$$\begin{aligned} -\Delta\psi^m &= \mathbf{0}, \ \psi^m|_{\mathcal{S}^m} = \mathbf{0}, \ \psi^m|_{\Gamma_d} = \psi_d \\ -\Delta\boldsymbol{p}^m &= (\psi^m - \psi_d)\boldsymbol{I}_{\mathcal{D}}, \ \boldsymbol{p}|_{\Gamma^m} = \mathbf{0} \end{aligned}$$

2. Set

$$\alpha = -\rho \frac{\partial p^m}{\partial n} \frac{\partial \psi^m}{\partial n} \qquad S^{m+1} = \{ x + \alpha n : x \in S^m \}$$

• 3. Set  $m \leftarrow m + 1$  and go to 1.

It works because

$$J(S^{m+1}) = J(S^m) + \int_{S^m} \xi \alpha = J(S^m) - 2\rho \int_{S^m} (\frac{\partial p^m}{\partial n} \frac{\partial \psi^m}{\partial n})^2 + o(\alpha)$$

Notice that there is a loss of regularity from  $S^m$  to  $S^{m+1}$ .

#### Implementation with freefem++

```
real x1 = 5, L=0.3;
mesh th = square(30, 30, [x, y * (0.2 + x/x1)]);
func D=(x>0.4+L \&\& x<0.6+L)*(y<0.1);
func psid = 0.8 \star y;
fespace Vh(th,P1);
Vh psi,p,w;
problem streamf(psi,w)=int2d(th) (dx(psi)*dx(w) + dy(psi)*dy(w))
   + on(1, 4, psi = y/0.2) + on(2, psi=y/(0.2+1.0/x1)) + on(3, psi=1);
problem adjoint (p, w) = int2d(th) (dx(p) * dx(w) + dy(p) * dy(w))
   - int2d(th)(D*(psi-psid)*w) + on(1,2,3,4,p=0);
Vh a=0.2+x/xl, gradE;
for(int i=0;i<100;i++) {</pre>
      streamf; adjoint;
      real E = int2d(th)(D*(psi-psid)^2)/2;
      gradE = dx(psi) * dx(p) + dy(psi) * dy(p);
      a=a(x, 0)-50*gradE(x, a(x, 0))*x*(1-x);
      th = square (30, 30, [x, y*a(x, 0)]);
}
```

### Regularity Preserving Algorithms: Sobolev Gradients

$$\alpha = -\rho \frac{\partial p}{\partial n} \frac{\partial \psi}{\partial n} \qquad S^{m+1} = \{ x + \alpha n : x \in S^m \}$$

can be replaced by

$$\begin{aligned} \frac{d^2 \tilde{\alpha}}{ds^2} &= \rho \frac{\partial p}{\partial n} \frac{\partial \psi}{\partial n} \ \tilde{\alpha}(s_0) = \tilde{\alpha}(s_1) = 0, \qquad \mathcal{S}^{m+1} = \{x + \tilde{\alpha}n : \ x \in S^m\} \\ \Rightarrow \quad J(S^{m+1}) - J(S^m) = \frac{2}{\rho} \int_{S^m} \tilde{\alpha} \frac{d^2 \tilde{\alpha}}{ds^2} = -\frac{2}{\rho} \int_{S^m} (\frac{d \tilde{\alpha}}{ds})^2 + o(\rho) \end{aligned}$$

Alternatively one may use a smoothing operator like

$$\beta \to \gamma(\beta) = v \text{ where } v \text{ is solution of } -\Delta v = 0 \quad \frac{\partial v}{\partial n}|_{\Gamma} = \beta.$$
  
Let  $\mathcal{S}^{m+1} = \{x + \gamma(\beta)n : x \in S^m\}$  with  $\beta = \frac{\partial p}{\partial n}\frac{\partial \psi}{\partial n}$   
 $J(S^{m+1}) - J(S^m) = 2\rho \int_{\Gamma} \gamma(\beta)\beta = 2\rho \int_{\Gamma} v \frac{\partial v}{\partial n} = -2\rho \int_{\Omega} |\nabla v|^2$ 

2.4

#### **Geometric Constraints**

• Projected Gradient: the case  $\int_{\Omega} = 1$ .

$$\Gamma' = \{ x + \alpha n(x) : x \in \Gamma \} \Rightarrow \delta J = \int_{\Gamma} \chi \alpha ds + o(|\alpha|)$$

$$\Gamma' = \{ x + (\alpha - \frac{1}{|\Gamma|} \int_{\Gamma} \alpha) n(x) : x \in \Gamma \}$$
  

$$\Rightarrow \delta \int_{\Omega} = \int_{\Gamma} (\alpha - \frac{1}{|\Gamma|} \int_{\Gamma} \alpha) + o(|\alpha|) = o(|\alpha|)$$
  

$$\delta J = \int_{\Gamma} (\chi - \frac{1}{|\Gamma|} \int_{\Gamma} \chi) (\alpha - \frac{1}{|\Gamma|} \int_{\Gamma} \alpha) ds + o(|\alpha|)$$

• Penalization: replace J by

$$J + \frac{1}{\epsilon} |F(\Omega)^+|^2 + \frac{1}{\omega} |G(\Omega)|^2$$

#### to maintain $F(\Omega \leq 0), \,\, {m G}(\Omega) = 0$

Pironneau (LJLL)

• Penalization: replace J by

$$J + \frac{1}{\epsilon} |F(\Omega)^+|^2 + \frac{1}{\omega} |G(\Omega)|^2$$

to maintain  $F(\Omega \leq 0), \ G(\Omega) = 0$ 

1 n

#### State Constraints

 $\min_{v} \{ J(u,v) : Au = g(v), F(u,v) \le 0 \}$ 

where A is a linear invertible operator.

 $\delta J = J'_u \delta u + J'_v \delta v$  with  $A \delta u = g'_v \delta v$ ,  $F'_u \delta u + F'_v \delta v \le 0$  if F(u, v) = 0

Introducing  $A^T p = J'_u$ ,  $A^T q = F'_u$  leads to

 $J'_{u}\delta u = \delta u \cdot A^{T} p = p \cdot A \delta u = p \cdot g'_{v} \delta v \qquad F'_{u}\delta u = \delta u \cdot A^{T} p = q \cdot A \delta u = q \cdot g'_{v} \delta v$ 

 $\delta J = (p \cdot g'_v + J'_v) \delta v$  with  $(q \cdot g'_v + F'_v) \delta v \le 0$  if F(u, v) = 0

A direction of descent is built from this. Notice that two adjoint vectors are needed

Pironneau (LJLL)

#### Example

Build a stealth airfoil with "good" aerodynamic properties

$$\min_{S} J := \int_{D} |u|^{2} : \int_{S} \frac{\partial \psi}{\partial n} = a \omega^{2} u + \Delta u = 0, \text{ in } \Omega \ u|_{\Gamma} = g -\Delta \psi = 0, \text{ in } \Omega \ \psi|_{\Gamma} = \psi_{d}$$

Requires the following **Lemma** 

$$\Gamma' = \{ \mathbf{x} + \alpha \mathbf{n} : \mathbf{x} \in \Gamma \} \Rightarrow \delta \int_{\Gamma} f = \int_{\Gamma} \alpha (\frac{\partial f}{\partial \mathbf{n}} - \frac{f}{R})$$

where R is the mean radius of curvature.

#### Example

Computed by A. Baron

Differentiable and quasi-differentiable methods

### The Minimum Drag Problem

$$J(\Omega) \equiv \min_{\Omega \in C, vol(C)=1} \int_{\Omega} \frac{1}{2} ||\nabla u||^2 dx : \qquad u|_{\partial \Omega} = g$$
$$u \nabla u + \nabla p - \nu \Delta u = 0, \qquad \nabla \cdot u = 0,$$

The solution exists in 2D if the nb of connected component is bounded. In 3D ? but probably yes because the criteria is the energy of the system. For safety regularize by adding  $\epsilon call(C)$ . Proposition

$$\partial \Omega' = \{x + \alpha n(x) : x \in \partial \Omega\} \Rightarrow ? \quad \delta J = \int_{\partial \Omega} \chi \alpha ds + o(|\alpha|)$$
  

$$\delta J = \int_{\partial \Omega} \alpha \frac{\partial u}{\partial n} \cdot \left(\frac{1}{2} \frac{\partial u}{\partial n} + \frac{\partial w}{\partial n}\right) + o(|\alpha|)$$
  
where  $-u \nabla w + w \nabla u^T + \nabla q - \nu \Delta w = \nu \Delta u, \quad \nabla \cdot w = 0, \quad w|_{\partial \Omega} = 0$   
rom JFM 73. See also, Modi, Gunzberger, Tasan, Jameson... Q?

Pironneau (LJLL)

MLA09 18 / 51

### The Minimum Drag Problem

$$J(\Omega) \equiv \min_{\Omega \in C, vol(C)=1} \int_{\Omega} \frac{1}{2} ||\nabla u||^2 dx : \qquad u|_{\partial\Omega} = g$$
$$u \nabla u + \nabla p - \nu \Delta u = 0, \qquad \nabla \cdot u = 0,$$

The solution exists in 2D if the nb of connected component is bounded. In 3D ? but probably yes because the criteria is the energy of the system. For safety regularize by adding  $\epsilon call(C)$ . **Proposition** 

$$\partial \Omega' = \{ \mathbf{x} + \alpha \mathbf{n}(\mathbf{x}) : \mathbf{x} \in \partial \Omega \} \Rightarrow ? \quad \delta \mathbf{J} = \int_{\partial \Omega} \chi \alpha d\mathbf{s} + \mathbf{o}(|\alpha|)$$
$$\delta \mathbf{J} = \int_{\partial \Omega} \alpha \frac{\partial u}{\partial n} \cdot (\frac{1}{2} \frac{\partial u}{\partial n} + \frac{\partial w}{\partial n}) + \mathbf{o}(|\alpha|)$$
where  $-u \nabla w + w \nabla u^T + \nabla q - \nu \Delta w = \nu \Delta u, \quad \nabla \cdot w = 0, \ w|_{\partial \Omega} = 0$ 

From JFM 73. See also, Modi, Gunzberger, Tasan, Jameson... Q? What minimal norm on  $\alpha$ ?

Pironneau (LJLL)

#### Proof

Recall that  $\delta \int_{\Omega} f = \int_{\Gamma} \alpha f$ . Then

$$\delta J = \int_{\Omega} \nabla u \cdot \nabla \delta u + \frac{1}{2} \int_{\partial \Omega} \alpha |\nabla u|^{2} + o(|\alpha|)$$
  
and  $\delta u \nabla u + u \nabla \delta u + \nabla \delta p - \nu \Delta \delta u = 0$ ,  $\nabla \cdot \delta u = 0$ ,  $\delta u|_{\Gamma} = -\alpha \frac{\partial u}{\partial n}$   
So  $\int_{\Omega} \nabla u \cdot \nabla \delta u = -\int_{\Omega} \delta u \Delta u$   
 $= -\frac{1}{\nu} \int_{\Omega} (-u \nabla w + w \nabla u^{T} + \nabla q - \nu \Delta w) \delta u$   
 $= -\frac{1}{\nu} \int_{\Omega} (\nabla \cdot (u \otimes \delta u + \delta u \otimes u) - \nu \Delta \delta u) w - \int_{\Gamma} \nu \frac{\partial w}{\partial n} \delta u + o(|\alpha|)$

Pironneau (LJLL)

Differentiable and quasi-differentiable method:

MLA09 25 / 51

#### Summary

- Optimal Shape Design of *S* relies on Optimization  $\min_{S} J(u, S) : A(S)u = f$
- The Continuous problem is well posed after regularization  $\min_{S} J(u, S) + \epsilon |S|^2 : A(S)u = f$
- The  $L^2$  local gradient  $\chi$  is computable by calculus of variation:  $\delta J = \int_{S} \chi \alpha + o(|\alpha|), \quad S(\alpha) = \{x + \alpha(x)n(x) : x \in S\}$
- The Sobolev gradient is the right tool for gradient methods:

$$-\Delta_{\mathcal{S}}\beta = \chi, \quad \mathcal{S}^{n+1} = \{x - \rho\beta(x)n(x) : x \in \mathcal{S}^n\}$$

イロト 不得 トイヨト イヨト 二日

 $\min_{\mathbf{S}\in\mathcal{S}_d} J(S) := \{ \int_D |\psi - \psi_d|^2 : -\Delta \psi = 0, \text{ in } C - \dot{S}, \quad \psi|_{\mathbf{S}} = 0 \quad \psi|_{\partial C} = \psi_d \}$ Discretization of gradients  $J'_{\alpha} = \nabla \psi \nabla p$  where  $-\Delta p = 2I_D(\psi - \psi_d),$  $p|_{\Gamma} = 0$  or derivation of gradient for the discrete problem?

#### Optimization of the Discrete Problem

- The Finite Element Method,
- Discrete Gradients
- Finite Volume Methods

#### The Finite Element Method

 $\Omega$  is covered with triangles  $T_k$  and  $q^i$  are the vertices. The PDE of the wind tunnel problem is approximated by

$$\int_{\Omega} \nabla \psi_h \nabla w_h = \mathbf{0}, \quad \psi_h|_{\mathcal{S}} = \mathbf{0}, \quad \psi_h|_{\Gamma} = \psi_d$$

for all  $w_h$  continuous and affine on each  $T_k$  and zero on  $\partial \Omega$ .

Let  $\delta q_h(x) = \sum_i \delta q_i w(x)$ , the basis  $\{w^j\}$ , the hat function of  $q_j$ .

Pironneau (LJLL)

Differentiable and quasi-differentiable methods

#### Summary: Continuous versus Discrete Gradient

$$\min_{\mathbf{S}\in\mathcal{S}_d} J(\mathbf{S}) := \{ \int_D |\psi - \psi_d|^2 : -\Delta\psi = 0, \text{ in } \mathbf{C} - \dot{\mathbf{S}}, \quad \psi|_{\mathbf{S}} = 0 \quad \psi|_{\partial \mathbf{C}} = \psi_d \}$$
  
$$\delta J = \int_S \frac{\partial p}{\partial n} \frac{\partial \psi}{\partial n} \text{ with } -\Delta p = 2(\psi - \psi_d) I_D$$
  
use normal displacement  $\approx v : -\Delta v = 0, \quad \frac{\partial v}{\partial n}|_{\Gamma} = \frac{\partial p}{\partial n} \frac{\partial \psi}{\partial n}$ 

For the discrete system

$$\begin{split} \min_{\mathbf{q}^{i} \in \mathcal{Q}_{d}} J(S_{h}) &= \{ \int_{D} |\psi_{h} - \psi_{d}|^{2} : \int_{\Omega} \nabla \psi_{h} \cdot \nabla w^{j} = 0, \ \forall j \ \psi_{h} |_{\mathbf{S}} = 0 \ \psi_{h} |_{\partial C} = \psi_{d} \} \\ \delta J &= \int_{\Omega} (\nabla \psi_{h} (\nabla \delta q_{h} + \nabla \delta q_{h}^{T}) \nabla p_{h} - \nabla \psi_{h} \cdot \nabla p_{h} \nabla \cdot \delta q_{h}) = \sum \chi_{j} \delta q^{j} \\ with \int_{\Omega} \nabla p_{h} \nabla w^{j} &= 2 \int_{D} (\psi_{h} - \psi_{d}) w^{j}, \ p_{h} \in V_{0h} \end{split}$$

And use a smoothed version of  $\chi_j$  to move the vertices and find the new shape (and triangulation).

MLA09 29 / 51

- Applies when the topology is not known
- Black-box favors Genetic algorithm (yet slow)
- Combine topological and geometrical shape design?

From T. Borrval and J. Petterson

From Schoenauer et al

### **Topological Derivatives**

Following the work of L. Tartar and N. Kikuchi, J. Sokolowski came with the following idea (f has zero mean, B(0, 1) the unit ball)

$$\begin{split} -\Delta u &= f \text{ in } \Omega, & u|_{\Gamma} = 0, \\ -\Delta u^{\epsilon} &= f \text{ in } \Omega \setminus B(x_0, \epsilon), & u^{\epsilon}|_{\Gamma} = 0, \\ & \text{Neumann or Dirichlet on } \partial B(x_0, \epsilon) = 0, \\ u'_{x_0}(x) &= \lim_{\epsilon \to 0} \frac{1}{\epsilon^{\gamma}} (u^{\epsilon} - u) \end{split}$$

exists and is not identically 0 or  $+\infty$  for some value of  $\gamma$ . **Theorem** For the Neumann (resp Dirichlet) problem  $\gamma = 2$  (resp  $log\epsilon$ ) in 2D and u' solves

$$\int_{\Omega} \nabla u \cdot \nabla w = c \nabla u \nabla w|_{x_0}$$

This is sufficient for gradient type algorithm, but convergence is usually a problem.

MLA09 31 / 51

### Applications of Topological Optimization

Stokes flow drag optimization (courtesy of M. Masmoudi)

MLA09 32 / 51

### Micro Channel flow (Borrval and Petterson)

Optimization of a micro channel flow averaged vertically gives

$$\min_{z(x)\in Z} j(u) := \int_{D} (u-u_d)^2 : \frac{5}{2z^2}u - \Delta u + \nabla p = 0, \quad \nabla \cdot u = 0, \quad u|_{\Gamma} = g$$

where the pointwise values of functions of *Z* are equal to  $\epsilon$  or h. Let  $\rho = 2.5z^{-2}$ ; notice that

$$[\rho u] = \bar{\rho}[u] + [\rho]\bar{u}$$
  $\bar{a} = \frac{a_1 + a_2}{2}$   $[a] = a_1 - a_2$ 

Therefore if u' exists, the derivative w/r " $\rho_2$  becoming  $\rho_1$ " at  $x_0$ , it must be

 $\bar{
ho}u' + 
ho'\bar{u} - \Delta u' + \nabla p' = 0$   $\nabla \cdot u' = 0$  with  $ho' = [
ho]\delta(x - x_0), \quad u' \mid \Gamma = 0$ 

But *u* is continuous so  $\bar{u} = u$ . Introduce the adjoint state *v*, *q* 

$$\bar{\rho}\mathbf{v} - \Delta\mathbf{v} + \nabla q = 0 \quad \nabla \cdot q = 2(u - u_d)\chi_D, \quad \mathbf{v} \mid \Gamma = 0 \Rightarrow \quad j' = -[\rho]u(x_0)p(x_0)$$

Replace :  $\rho_2$  by  $\rho_1$  at  $x_0$  when  $[\rho]u(x_0)p(x_0) \ge 0_0$ , where  $\rho_2$  is the set of the set

#### Important Applications

Solid mechanics: Weight optimization of airplanes, cars, parts...

Topological optimization of the weight of a stool for a given strength (courtesy of F. Jouve et al)

#### Steepest Descent with Mesh Refinement

Now consider the same algorithm with parameter refinement

#### Algorithm

```
(Steepest descent with refinement)
   while h > h_{min} do
   ł
       while || \operatorname{grad}_z J_h(z^m) || > \epsilon h^{\gamma} \operatorname{do}
           z^{m+1} = z^m - \rho \operatorname{grad}_z J_h(z^m) where \rho such that,
                       -\beta\rho \|\boldsymbol{w}\|^{2} < J_{b}(\boldsymbol{z}^{m}-\rho\boldsymbol{w}) - J_{b}(\boldsymbol{z}^{m}) < -\alpha\rho \|\boldsymbol{w}\|^{2}
             with w = \operatorname{grad}_z J_h(z^m) Set m := m + 1;
       h := h/2;
```

- Convergence obvious : it is either S.Descent or  $\operatorname{grad} J_h \to 0$  because  $h \to h/2$ .
- Gain in speed : we do not need the exact gradient  $\operatorname{grad}_z J_h!$
- Let *N* be an iteration parameter and  $J_{h,N} \approx J_h$  and  $\operatorname{grad}_z J_{h,N} \approx \operatorname{grad}_z J_h$  in the sense that

 $\lim_{N \to \infty} J_{h,N}(z) = J_h(z) \quad \lim_{N \to \infty} \operatorname{grad}_{zN} J_{h,N}(z) = \operatorname{grad}_z J_h(z)$ 

Add *K* and N(h) with  $N(h) \rightarrow \infty$  when  $h \rightarrow 0$ :

- ロ ト - ( 同 ト - ( 回 ト - ) 回 ト - ) 回

#### Algorithm

(E. Polak et al)(Steepest descent with Goldstein's rule mesh refinement and approximate gradients)

while  $h > h_{min}$ { while  $| grad_{zN}J^{m} | > \epsilon h^{\gamma}$ { try to find a step size  $\rho$  with  $w = grad_{zN}J(z^{m})$ 

$$-\beta\rho \|\boldsymbol{w}\|^{2} < J(\boldsymbol{z}^{m}-\rho\boldsymbol{w}) - J(\boldsymbol{z}^{m}) < -\alpha\rho \|\boldsymbol{w}\|^{2}$$

if success then  $\{z^{m+1} = z^m - \rho \operatorname{grad}_{z_N} J^m; m := m+1;\}$ else N := N + K;  $\}$ h := h/2; N := N(h);

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

#### algorithm

The convergence could be established from the observation that Goldstein's rule gives a bound on the step size:

$$-\beta\rho \operatorname{grad}_{z} J \cdot h < J(z+\rho h) - J(z) = \rho \operatorname{grad}_{z} J \cdot h + \frac{\rho^{2}}{2} J'' h h$$
  
$$\Rightarrow \quad \rho > 2(\beta-1) \frac{\operatorname{grad}_{z} J \cdot h}{J''(\xi) h h} \quad \text{so } J^{m+1} - J^{m} < -2 \frac{\alpha(1-\beta)}{\|J''\|} |\operatorname{grad}_{z} J|^{2}$$

Thus at each grid level the number of gradient iterations is bounded by  $O(h^{-2\gamma})$ . Therefore the algorithm does not jam hence convergence.

#### Finite Difference Gradient

$$\frac{f(x+h) - f(x)}{h} = f'(x) + f^{(2)}\frac{h}{2} - f^{(3)}\frac{h^2}{6} + \dots$$

$$\mathcal{R}e\frac{f(x+ih) - f(x)}{ih} = f'(x) + O(h^2)$$

$$\frac{f(x+h) - f(x-h)}{2h} = f'(x) + f^{(3)}\frac{h^2}{6} + f^{(5)}\frac{h^4}{60} + \dots$$

$$\frac{f(x+h) - f(x-h)}{4h} + \mathcal{R}e\frac{f(x+ih) - f(x-ih)}{4ih} = f'(x) + O(h^6)$$

Pironneau (LJLL)

Differentiable and quasi-differentiable methods

• • • • • • • • • • • •

#### Principle of Automatic Differentiation

Let  $J(u) = |u - u_d|^2$ , then its differential is

$$\delta J = 2(u - u_d)(\delta u - \delta u_d)$$
  $\frac{\partial J}{\partial u} = 2(u - u_d)(1.0 - 0.0)$ 

Obviously the derivative of *J* with respect to *u* is obtained by putting  $\delta u = 1$ ,  $\delta u_d = 0$ . Now suppose that *J* is programmed in C/C++ by

```
double J(double u, double u_d){
    double z = u-u_d;
    z = z*(u-u_d);
    return z;
}
int main(){ double u=2,u_d = 0.1;
    cout << J(u,u_d) << endl;
}</pre>
```

A program which computes *J* and its differential can be obtained by writing above each differentiable line its differentiated form:

Pironneau (LJLL)

#### A simple example (cont)

```
class ddouble {public: double v,d;
ddouble(double a, double b=0) { v = a; d=b; }
};
ddouble JandDJ(ddouble u, ddouble u d)
{
    ddouble z;
        z.d = u.d - u d.d;
        z.v = u.v-u d.v;
        z.d = z.d * (u.v - u d.v) + z.v * (u.d - u d.d);
        z = z * (u - u d);
        return z;
int main()
 {
      ddouble u(2.,1.), u_d = 0.1, J = JandDJ(u,u_d);
       cout << J << " dJ="<<dJ<<endl;</pre>
 }
```

#### The class double

```
class ddouble{ public: double v[2];
ddouble(double a, double b=0) { v[0] = a; v[1]=b; }
ddouble operator=(const ddouble& a)
  { val[1] = a.v[1]; val[0]=a.v[0];
    return *this;
  }
friend ddouble operator-(const ddouble& a, const ddouble& b)
       {
            ddouble c;
            c.v[1] = a.v[1] - b.v[1]; // (a-b)'=a'-b'
            c.v[0] = a.v[0] - b.v[0];
            return c;
friend ddouble operator* (const ddouble& a, const ddouble& b)
            ddouble c;
            c.v[1] = a.v[1]*b.v[0] + a.v[0]*b.v[1];
            c.v[0] = a.v[0] * b.v[0];
            return c; }
};
                                       イロト イポト イヨト イヨト 二日
                                                    MLA09
                                                         43/51
```

### A Simple Example (final)

```
#include "ddouble.hpp"
ddouble J(ddouble u, ddouble u d) {
    ddouble z = u-u d;
    z = z * (u - u d);
    return z;
 }
int main() {
   ddouble u=2, u d = 0.1;
   u.v[1]=1;
    cout << J(u,u d).v[1] << endl;
 }
```

# Simply replace all double by ddouble and link with the class lib. A few pitfalls: e.g.

### Limitations

```
program newtontest
x=0.0;
al=0.5 subroutine newton(x,n,al)
call newton(x,10,al) do i=1,n
write(*,*) x f = x-alpha*cos(x)
end fp= 1+alpha*sin(x)
x=x-f/fp
enddo
return
end
```

2n adjoint variables are needed! while the theory is

$$f(x,\alpha) = 0 \Rightarrow x'f'_x + f'_\alpha = 0 \Rightarrow x' = -\frac{f'_\alpha}{f'_x}$$

So it is better to understand the output of AD-reverse and clean it. see www.autodiff.org

Pironneau (LJLL)
