Processes & use of e-Freight standards

Process scenarios

Scope & benefits

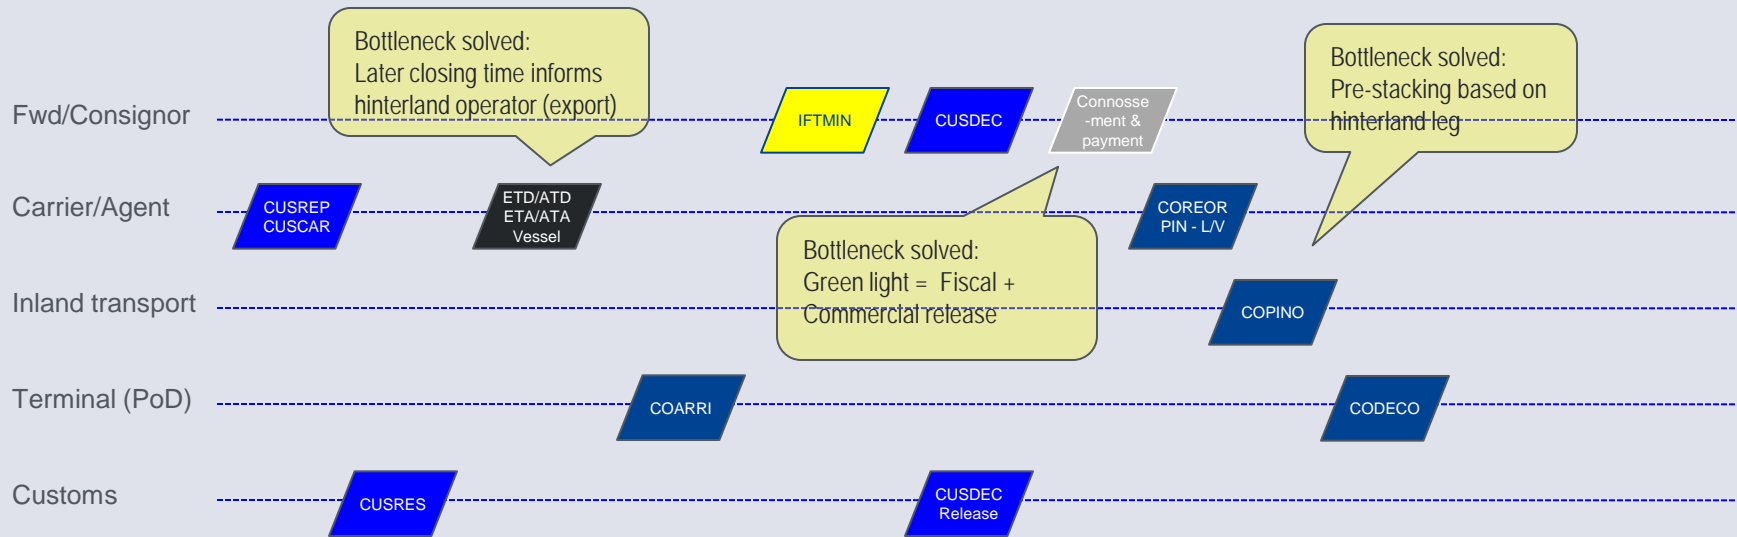

Sea/hinterland interface

Logistics Process

Information Process

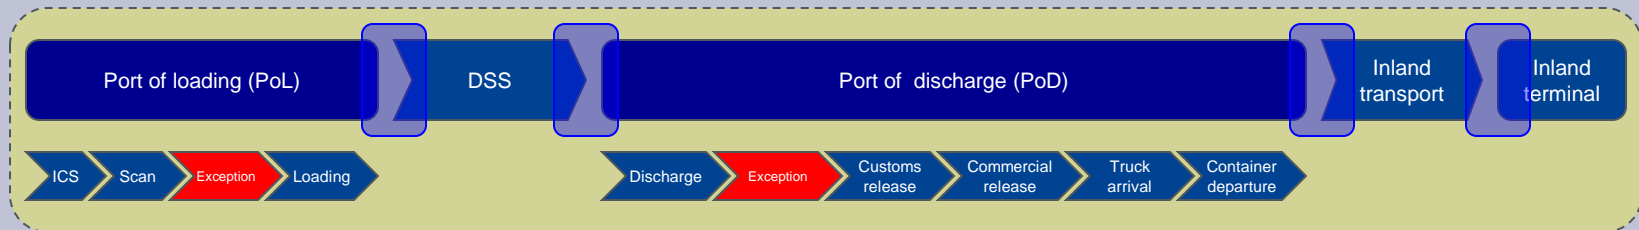

STL: Secure trade lanes

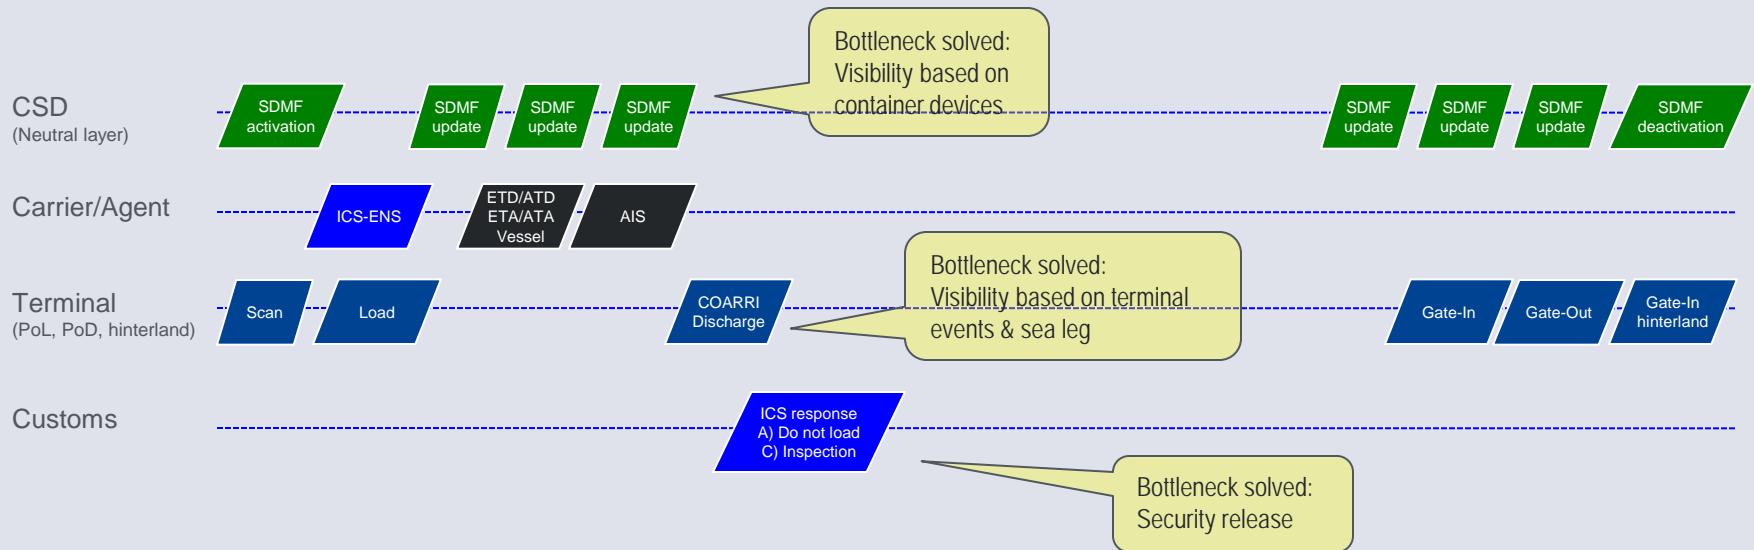

Smart-CM, Integrity

Logistics Process

Information Process

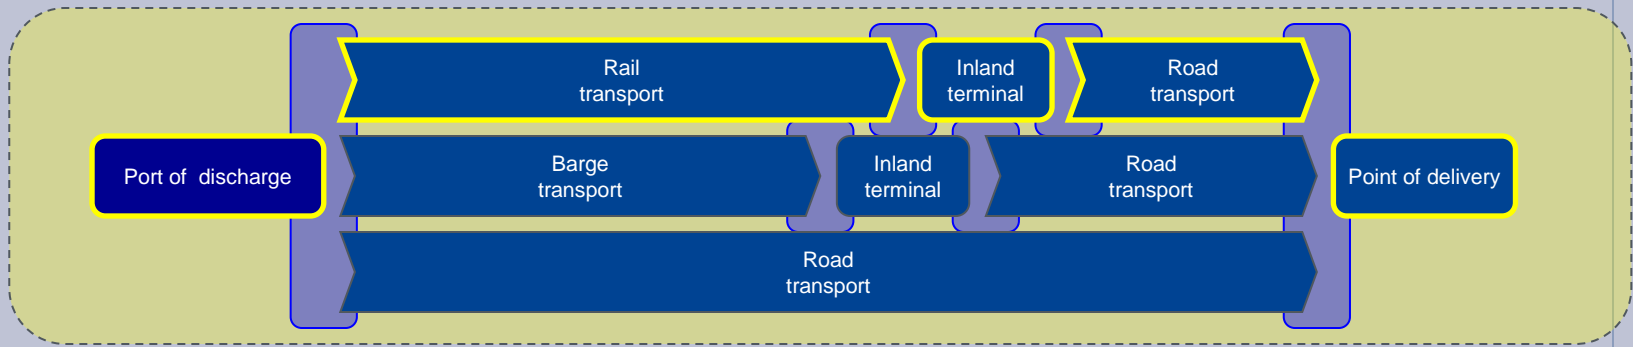

Door-to-door co-modal transport chains

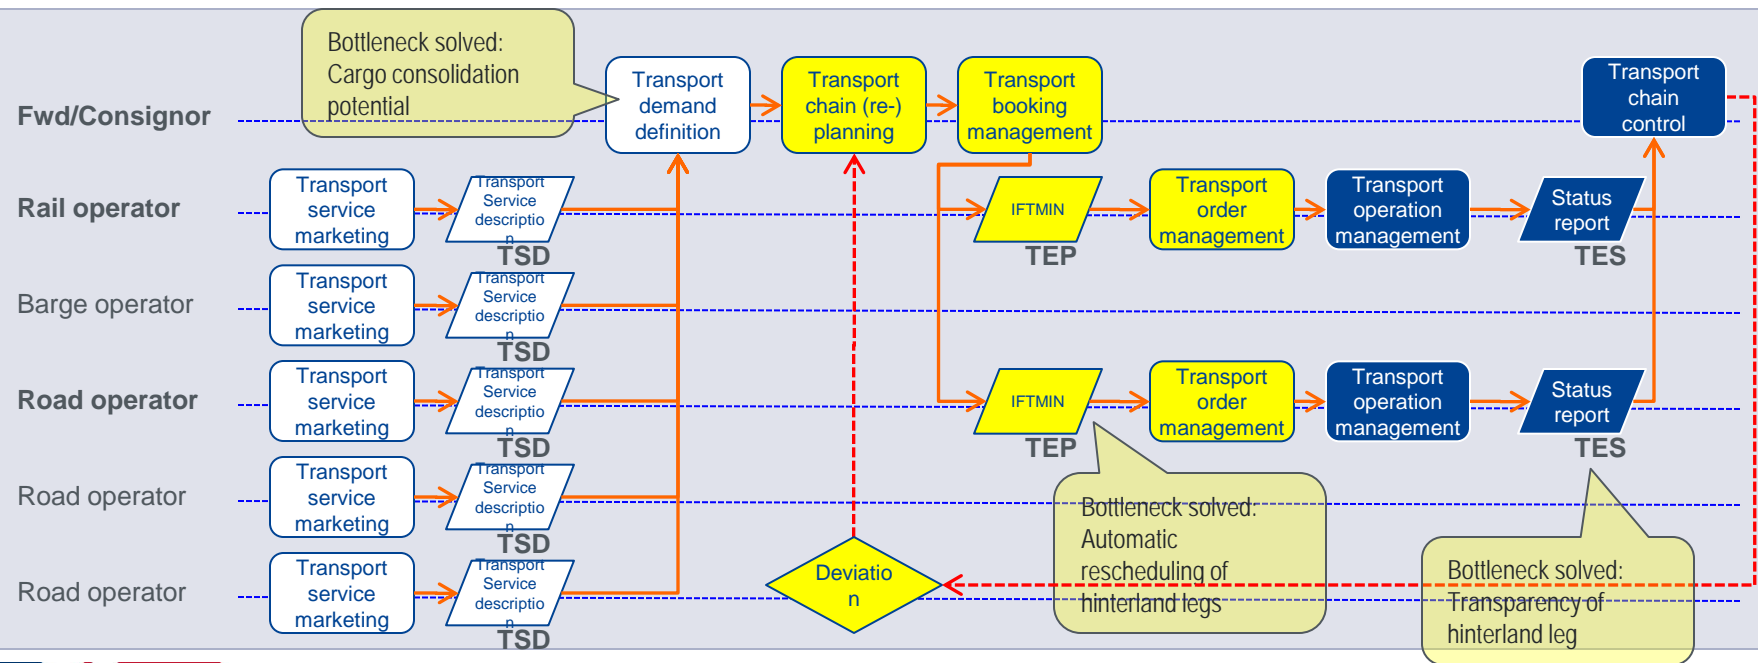

Freightwise, DiSCwise

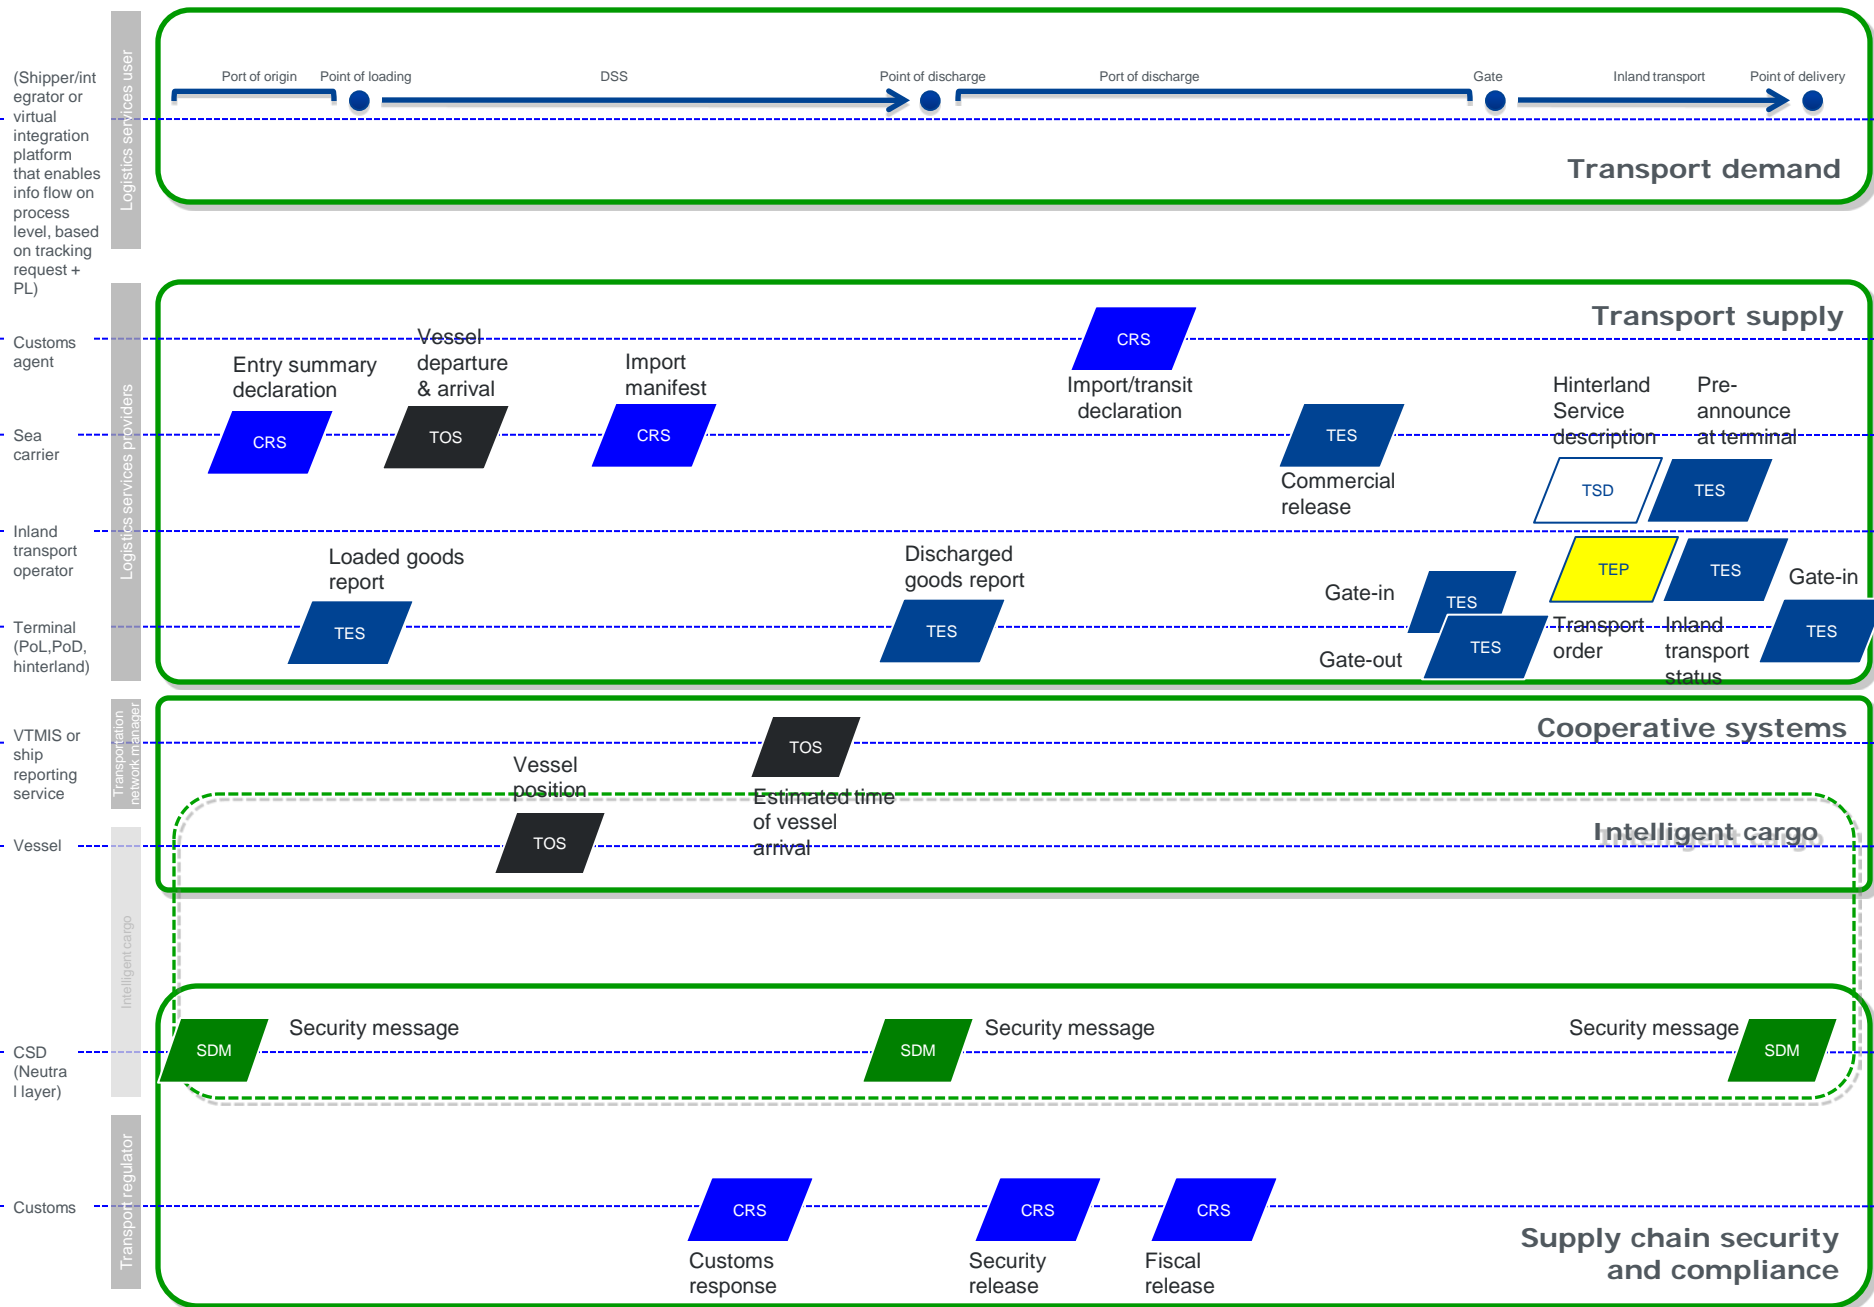

Logistics Process

Information Process

Integrated scenario – Using the Common framework

Quantified benefits

Benefits

Average container values

Source	Average Value
Matthew O'Sullivan – IUMI 2006	\$80,000 - \$210,000
Munich Re: Estimate	\$80,000 - \$100,000
XL Re Studies	\$35,000 - \$120,000
Hyundai Fortune (Multiple sources)	\$204,000 - \$300,000
MSC Carla (AIMU RI Committee Survey)	\$74,000
APL China (AIMU RI Committee Survey)	\$211,000
Guy Carpenter: Japan – LA	\$90,000
Guy Carpenter: LA – Japan	\$30,000
AIMU Reinsurance Committee	\$95,000

Route	Average Value	Standard Deviation
North America – Asia	\$17,795	\$102,163
North America - Europe	\$28,480	\$76,081
Europe - Asia	\$21,663	\$89,863
Europe – North America	\$26,424	\$55,020
Asia – North America	\$30,477	\$41,517
USA – China	\$10,840	\$64,077
USA – Japan	\$77,144	\$301,929
USA - Australia	\$22,065	\$51,267

Best assumption we can make is that, for the Europe – Asia route:

- The average container value on the Europe – Asia route is EUR 20.000
- 70% of these container values will be smaller than EUR 85.000 (average +/- σ)
- 95% of these container values will be smaller than EUR 150.000 (average +/- 2σ)

Benefits

Short term benefits

Savings area	
Hinterland operator – Truck <i>Less waiting times at terminal</i>	<p>Applicable to 15-20% of import containers x 20 minutes on average per container x 50 Euro/hr waiting costs</p> <p><i>Calculation example:</i> <i>Assumptions: Applicable to 15% of import containers</i> <i>Result: Waiting time savings = 15% x 20 min x 50 Euro/hr</i> <i>= 2,5 Euro per container</i></p>
Hinterland operator – Barge <i>Less waiting times at terminal</i>	<p>Savings are expected to be higher, as a single delay for 1 specific container can impact multiple containers in the barge, even though the waiting costs per container are less;</p> <p><i>Calculation example:</i> <i>Result: Savings are in the magnitude of +/- 5 Euros per container as a result of efficiency gains for individual transport & logistics service providers</i></p>
Sea container terminal <i>Less container moves</i>	<p>10-20% x 144 Euro</p> <p>This joint effort Assumptions: Quality</p> <p><i>Calculation example:</i> <i>Assumption:</i> <i>- Applicable to 10% of import containers</i> <i>- 15% less container moves</i> <i>Result: Terminal savings = 15% x 10% x 144 Euro = 2,16 Euro</i></p>
Container carrier <i>Shorter stay in port</i>	<p>More efficient terminal handling will also lead to shorter stays in the port, resulting in less port dues;</p> <p><i>Calculation example:</i> <i>To be prudent, we assume such savings not to be made on short term, as fewer container moves will probably first benefit the land-side not the sea-side.</i></p>

Savings are in the magnitude of +/- 5 Euros per container as a result of efficiency gains for individual transport & logistics service providers
Best applicable to containers of less average value (10.000 Euro)

Benefits

Long term benefits

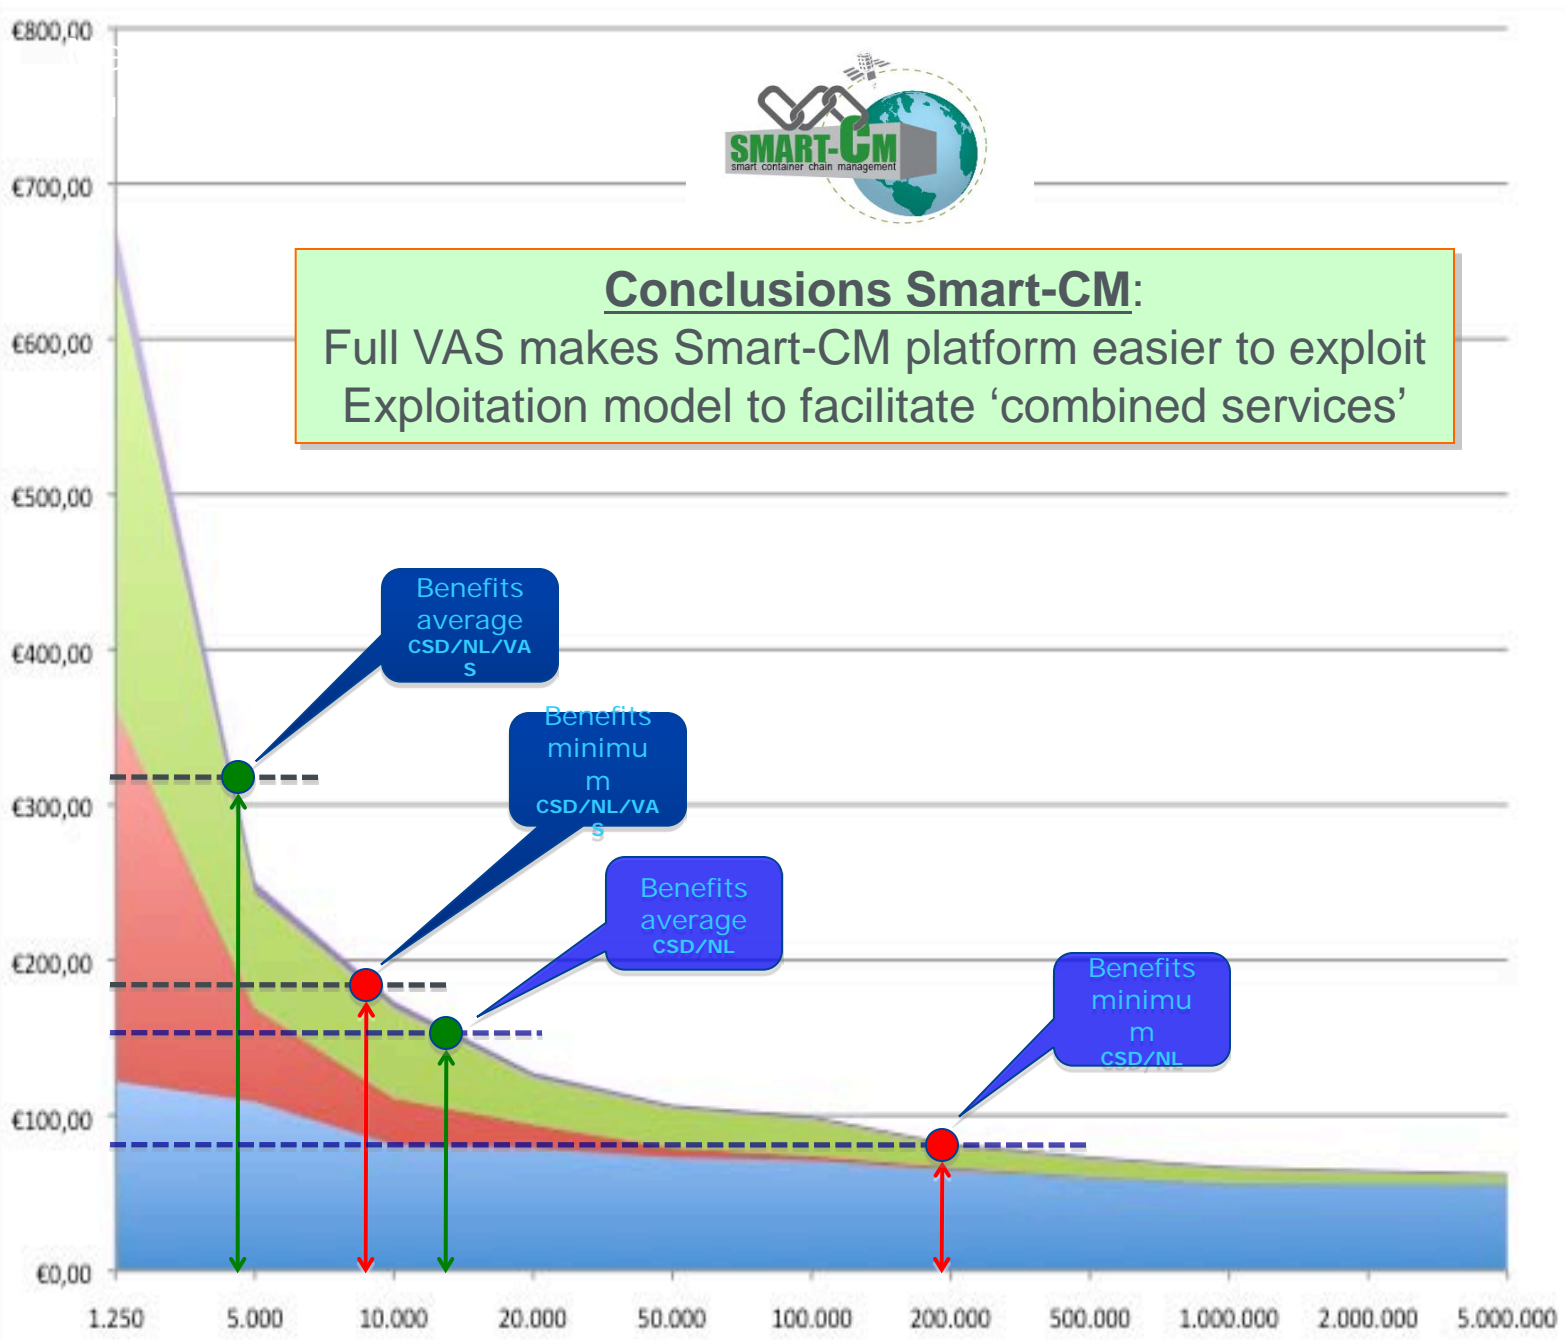

Savings area	
<p>Safety stock <i>The reduction of stocks held in order to cope with variability in lead time</i></p>	<p>Container value x 7% p.a. (per annum) x deviation multiple Z (= 2/3/4 for a 95/97/99% service level) x reduction in lead time variability (σ) + 25% additional inventory carrying costs</p> <p>Long term benefits have focussed on improvement of the reliability of the logistics process. Examples:</p> <p>Ship missing, i.e. container misses loading on planned vessel Unscheduled transshipment (to other vessel, late arrival in same PoD, changed PoD) Delayed departure at PoL or arrival at PoD Release status of the container Timely gate-out at PoD</p>
<p>Pipeline inventory <i>The reduction of stocks held during transport</i></p>	<p>Savings potential is in the magnitude of +/- 300 Euros per imported container of value 100.000 Euro. Most of these (70-80%) are financial gains as a result of reduced pipeline & safety stocks, directly depending on the average container value. This affects working capital requirements.</p>
<p>Service charge <i>The costs charged by transport operators in the door-to-door chain esp. on-carriage services that have to be rebooked after deviations occur</i></p>	<p>This applies mostly to the shipper or beneficial cargo owner (BCO). If realized by the logistics integrator, he may be able to sell his services with a premium to shipper or BCO.</p>
<p>Administrative labour <i>The costs of forwarding, including the collection of status information and the use of that information when managing deviations; also the costs of compliance can be included</i></p>	<p><i>It requires data that goes beyond the port. This is done either by deploying container tracking devices or by collecting alternative status data from transport providers and terminal operators in the chain. It may apply to a limited part of the imported containers.</i></p>
<p>Pilferage, thefts <i>The costs of goods lost or damaged</i></p>	<p>x anticipated percentage reduction in insuranceliability costs due to device use (1%)</p> <p>Calculation example: Container value = 100.000 EUR Result: Pilferage/theft savings = 10 EUR per container</p>

Allowable costs

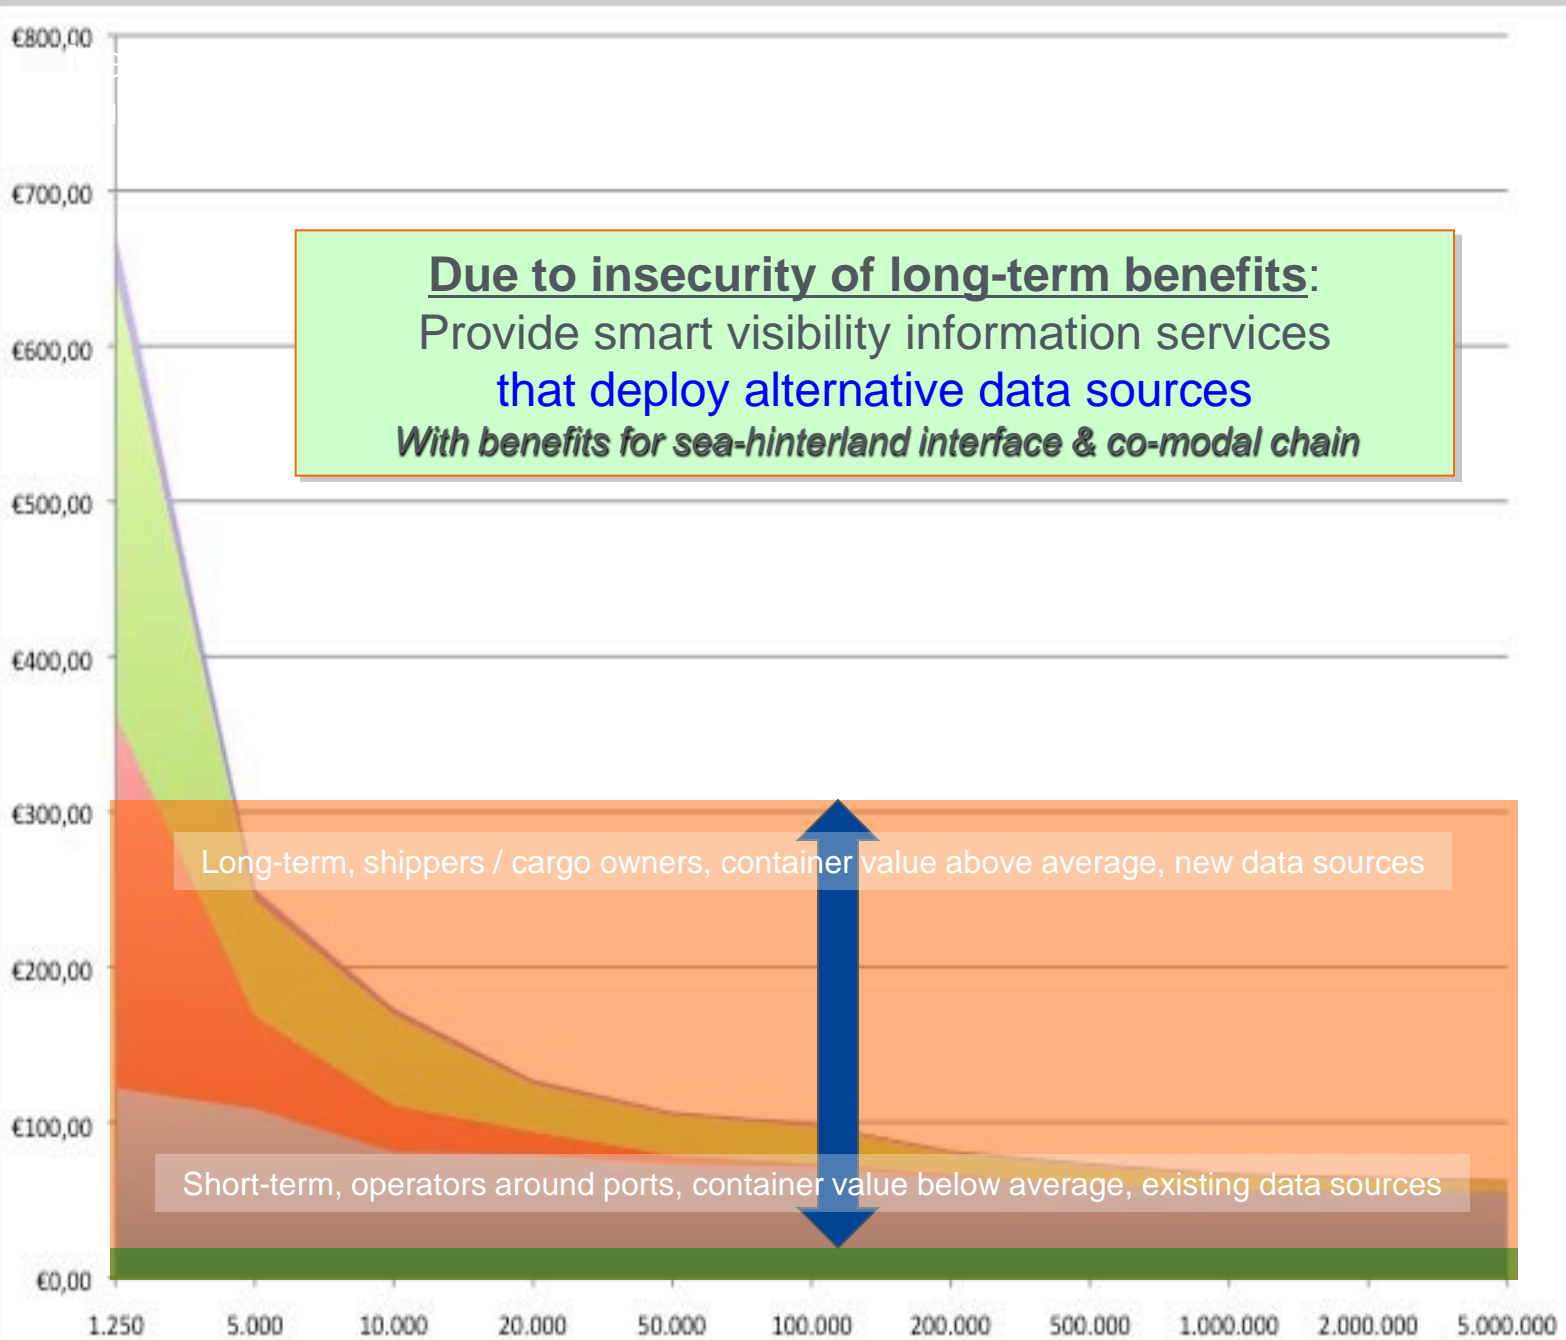

Conclusions Smart-CM:
 Full VAS makes Smart-CM platform easier to exploit
 Exploitation model to facilitate 'combined services'

- Value added service
- Neutral layer ICT platform
- Neutral organization
- CSD

Assumption:
 -100.000 EUR Per container
 -EDC76, 6/yr
 -VAS does not include costs for other components

Due to insecurity of long-term benefits:
 Provide smart visibility information services
 that **deploy alternative data sources**
With benefits for sea-hinterland interface & co-modal chain

Long-term, shippers / cargo owners, container value above average, new data sources

Short-term, operators around ports, container value below average, existing data sources

- Value added service
- Neutral layer ICT platform
- Neutral organization
- CSD

- Assumption:
- 100.000 EUR Per container
 - EDC76, 6/yr
 - VAS does not include costs for other components

Collaborative information services

Collaborative information services

Driving forces for 'go to market' strategy

Specialization to reduce development costs: Each of the product components mentioned has substantial costs for development. Specialization is a method to reduce such costs by creating economies of scale.

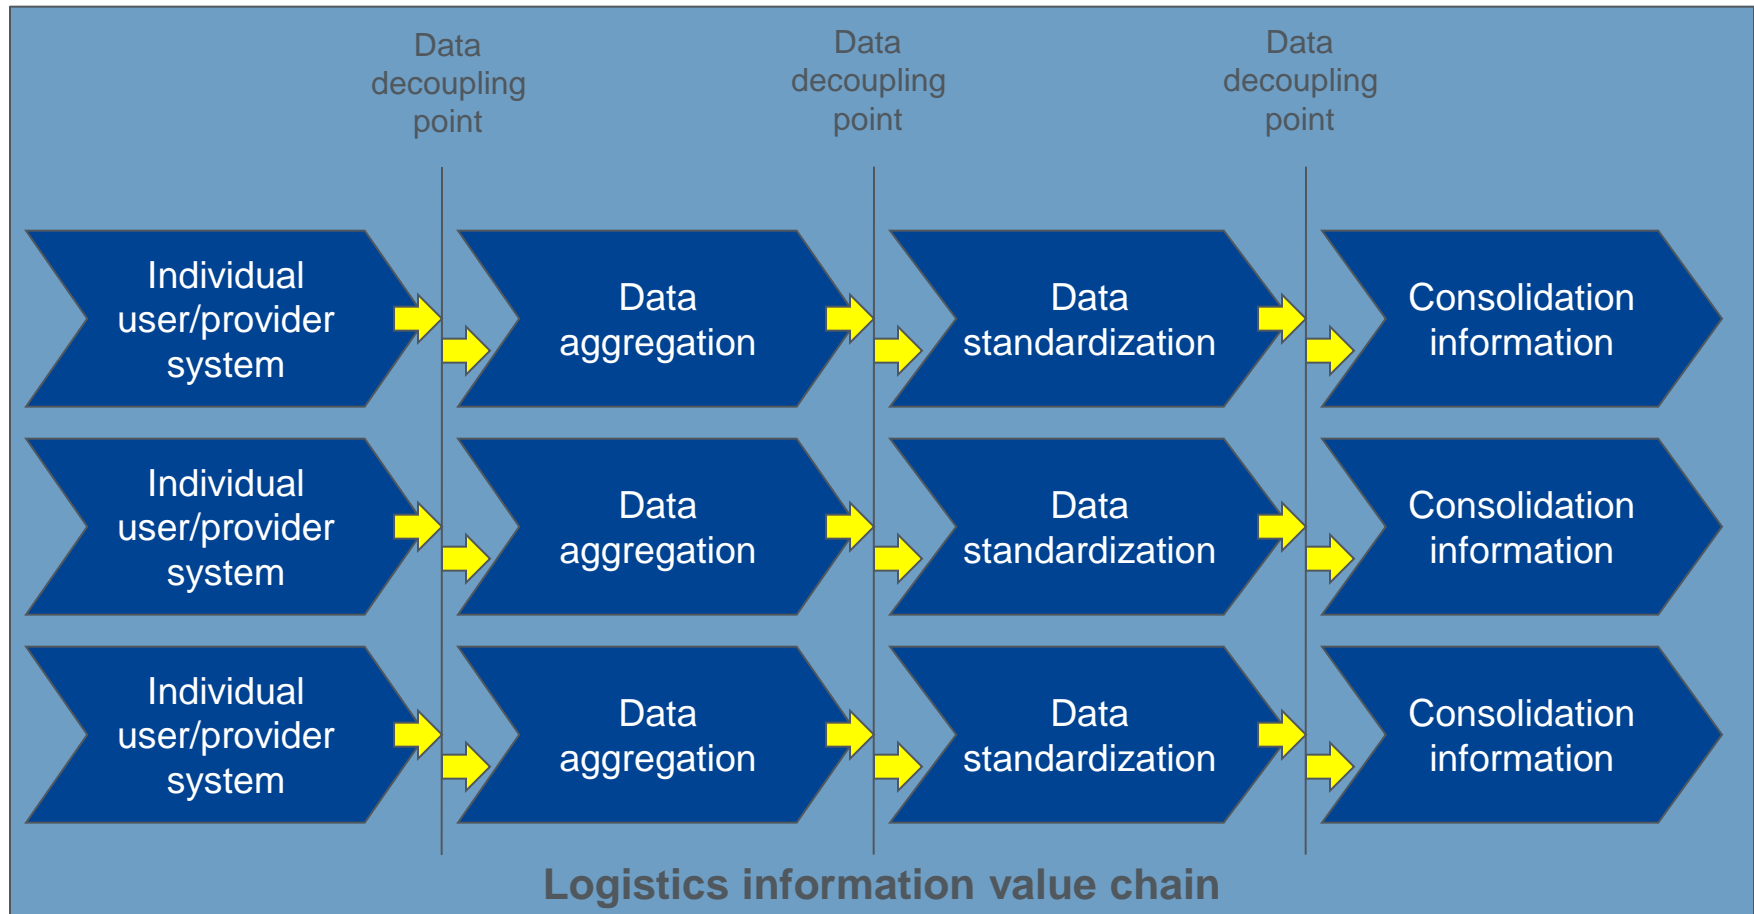

Ensuring critical amount of data access: Access to data providers is important in order to make value added services functional. If there is no data to populate the VAS, then the functionality of the VAS itself cannot be used.

Create footprint towards potential market: Apart from access to specialized data provides, access to large numbers of transport & logistics operators increases the amount of data that can be captured directly from the operators. It also simplifies sales if large numbers of shippers, beneficial cargo owners and transport & logistics operators are already connected.

Collaborative information services

Logistics information value chain

Added value:
Access to data
Access to users

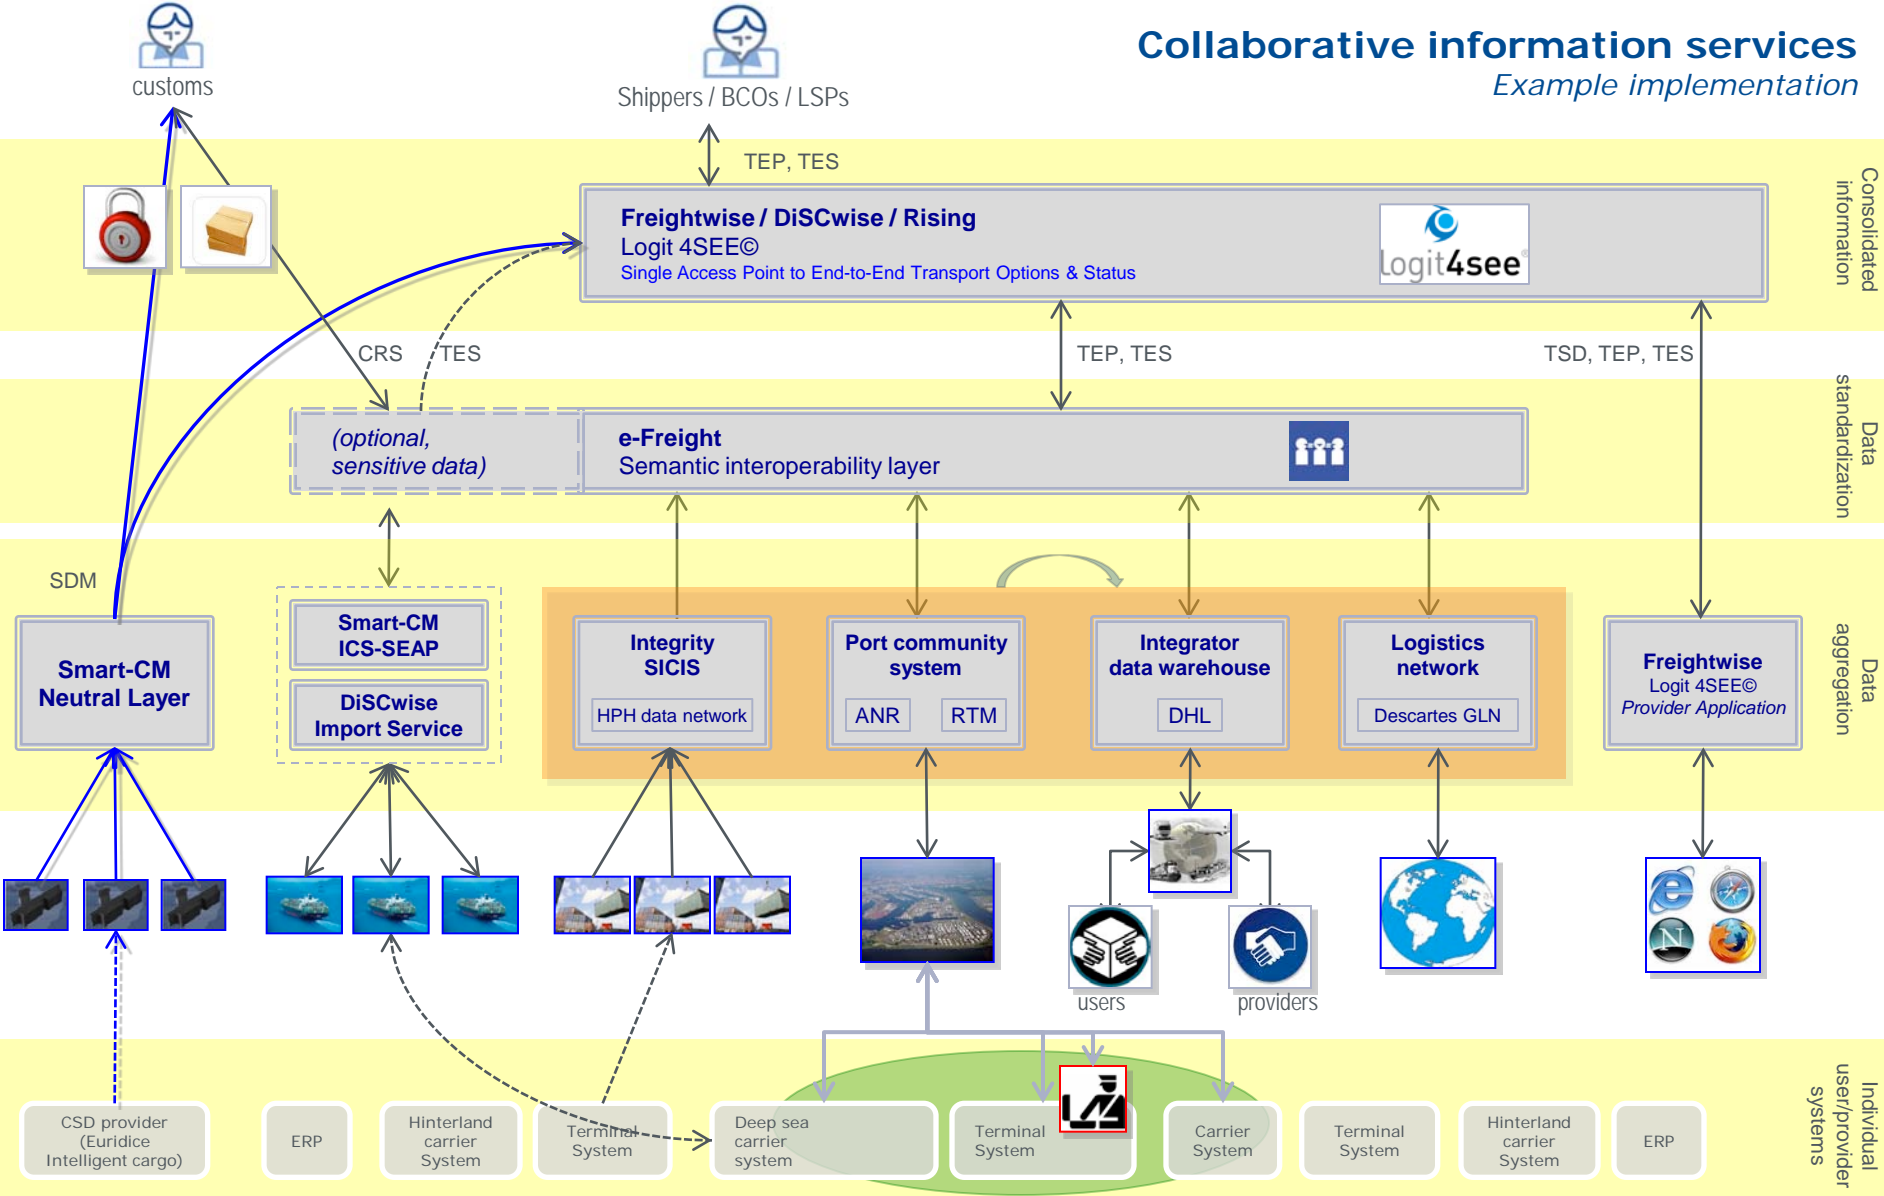

Added value:
Low cost entry
Low cost substitution

Added value:
Higher-value information
Single access point

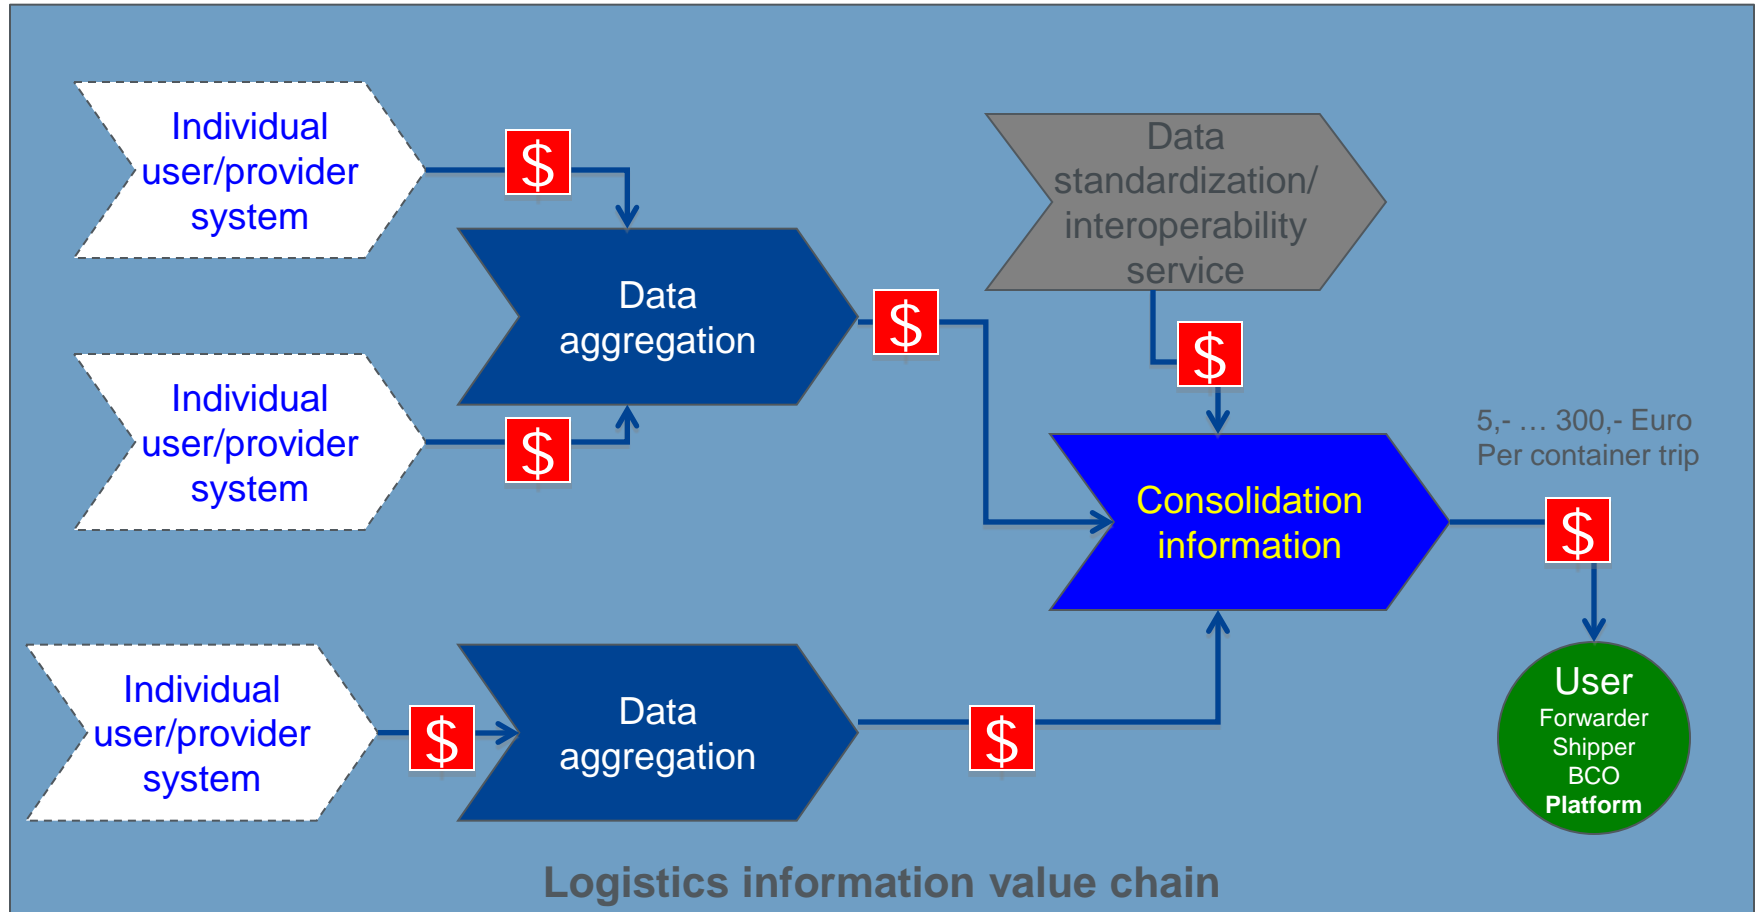

Collaborative information services

Example implementation

Collaborative information services

Possible charging mechanism A – Functional integration

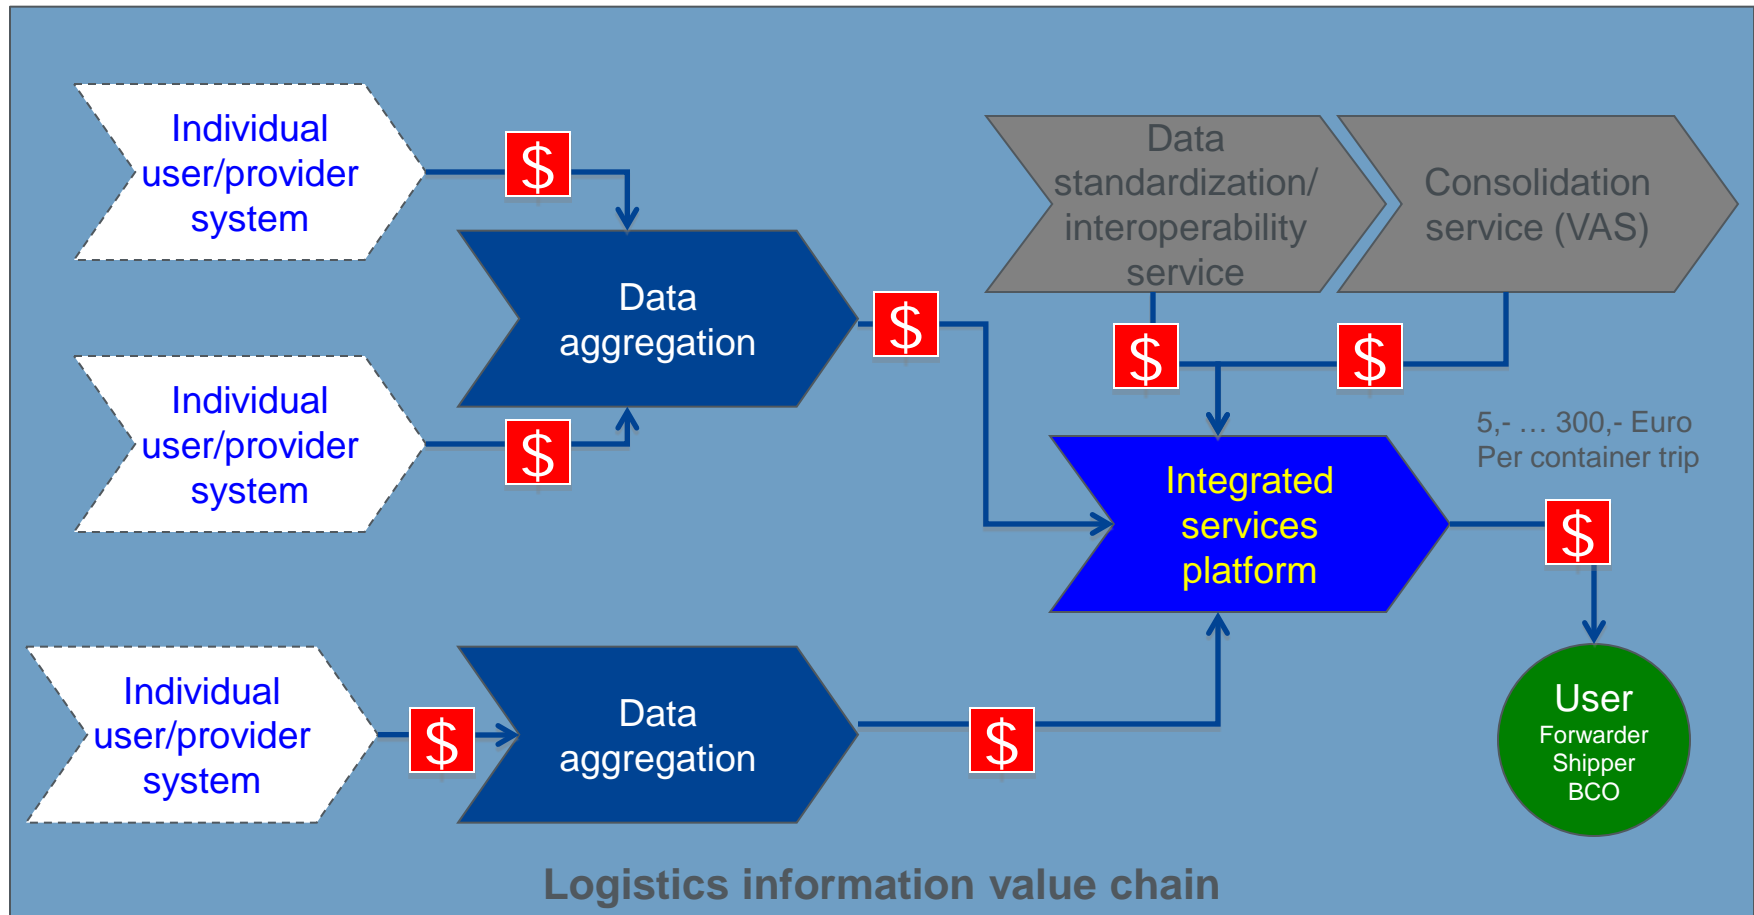

COMCIS (26-1-2011)

Collaborative information services

Possible charging mechanism B – Integration based on footprint

Collaborative information services

Phases in approaching the market

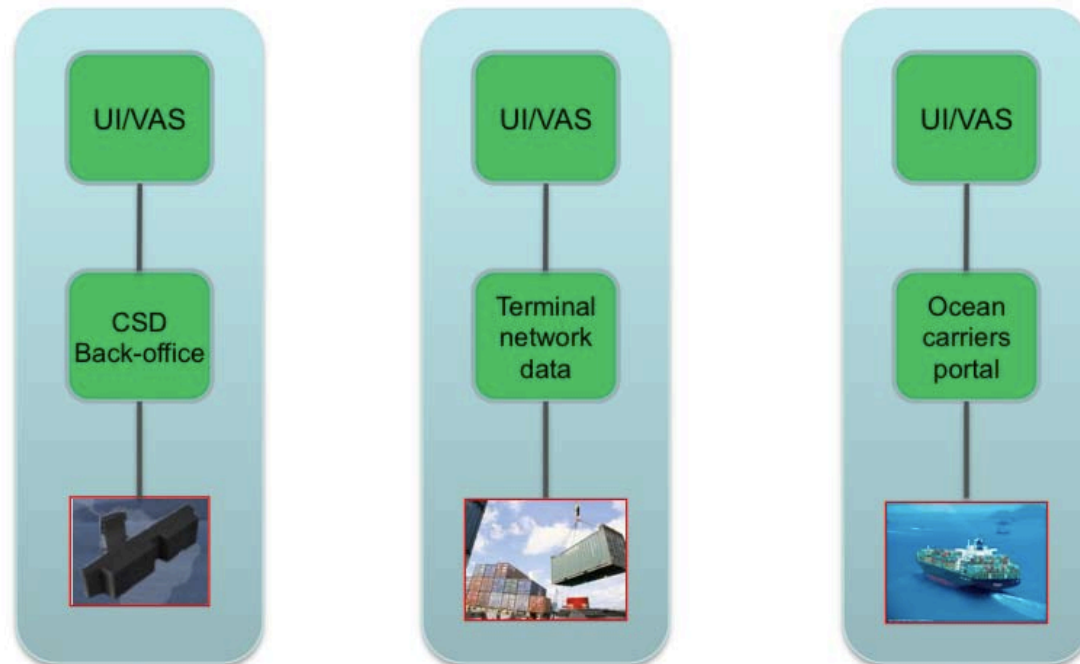

Short term:

A **bundling of product components** that ensures access to data & value added services;

Providers of individual product components are few;

Bring an offer to the market where all relevant components are included;

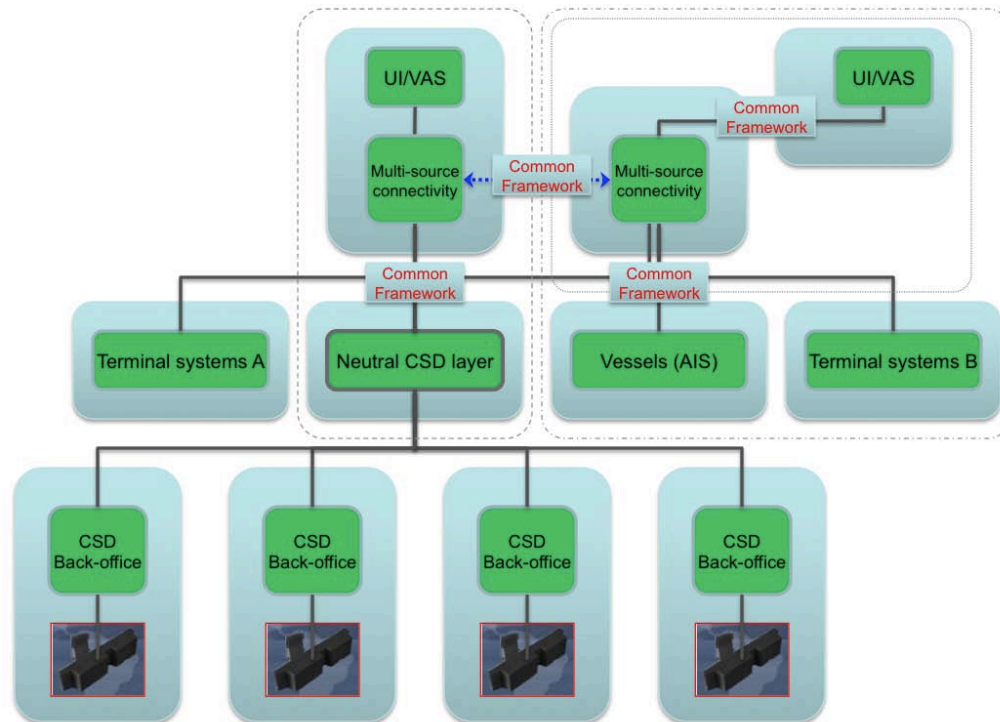

Collaborative information services

Phases in approaching the market

Mid term:

An **interoperable market** in which value added services establish **coalitions** (and agreements) for longer periods with data sources and connectivity services;
This enables **specialization** but at the same time ensures them of sufficient **marketing channels** to enable them to invest in further development of their specialized products;
As time goes by the interfaces between the individual product components will be more and more **standardized**;

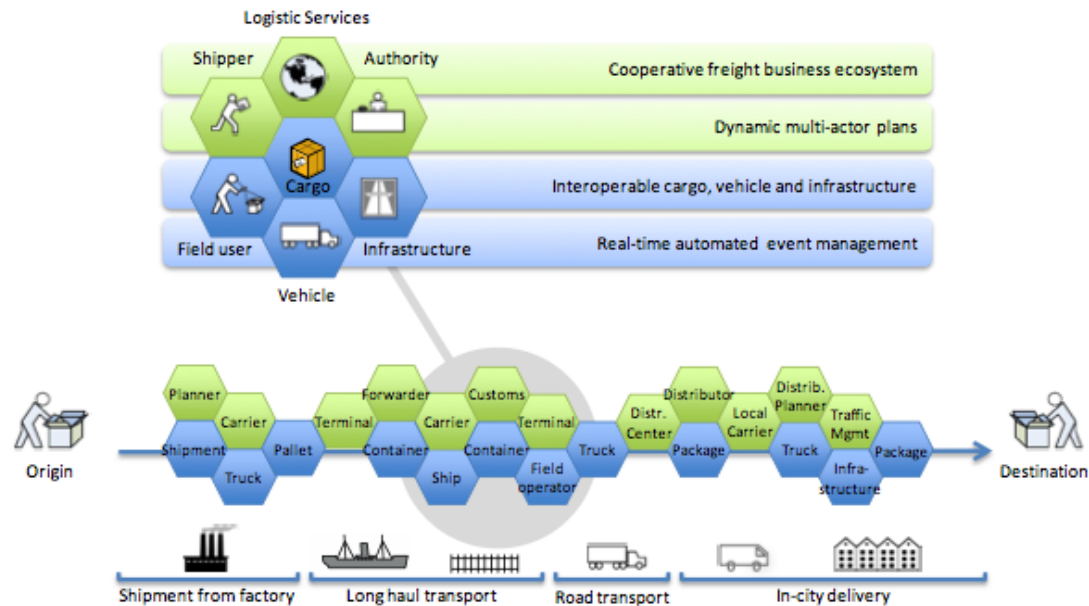

Collaborative information services

Phases in approaching the market

Long term:

An **open spot market** in which value added services can be used to **discover** intelligent load and cargo units, data sources and applications, **configure** which data sources to use for which client or shipment, **settle on the terms** of use of data sources, and complete the cycle by enabling aggregated **billing** to the end-user;

Collaborative information services

Points of attention

- **Data protection & sharing:** This should follow agreements between provider and user of data. One particular issue is reusing/reselling of data.
- **Accuracy & reliability of data:** This is a key aspect, as we are consolidation multiple data sources into information that should be able to support decision making processes.
- **Configurability:** The user should be able to select, dynamically, what data sources, services and features to deploy for specific containers, customers, trade lanes. In this way he can select data and features that match the expected benefit.
- **Quality of data:** In case multiple conflicting data sources are used, the user should be able to select which sources has preference. An audit trail should be provided as to what data was used to support which decision.

One snapshot for logistics

Consolidating data in the transport chain

One single service

to plan and follow up multi modal logistics chains

Aggregation & correlation of data

to cover blind spots & support decisions

True visibility

to proactively reduce impact of deviations

Thank you for your attention!
