

Hide the Stack: Toward Usable Linked Data

A.-S. Dadzie¹, M. Rowe² & D. Petrelli³

1. The OAK Group, Dept. of Computer Science, The University of Sheffield
2. The Knowledge Media Institute, The Open University
3. Art & Design Research Centre, Sheffield Hallam University

Key Message

- Linked Data
 - connections between disparate, independent (albeit related) data
 - rendering public interest data accessible
 - allowing hidden information to be discovered more easily
 - enabling questions to be answered more fully
 - Potential widely recognised, but
 - very large-scale, wide-coverage, highly inter-linked data repositories
 - under-utilised outside Semantic Web community
- Aims of the research
 - explore new methods for presenting Linked Data to wider audience
 - support more intuitive exploration and knowledge retrieval
 - encourage wider use by web-savvy but non-technical users

Outline

- Challenges
- Illustrative Scenario
- Existing Work
- Approach
- Initial Evaluation
- Conclusions & Next Steps
- Acknowledgements

Challenges in Linked Data Consumption

1. Combating information overload
2. Exploration starting point
3. Returning something *useful*
4. Enabling interaction

How can we make Linked Data usable to real, end users?

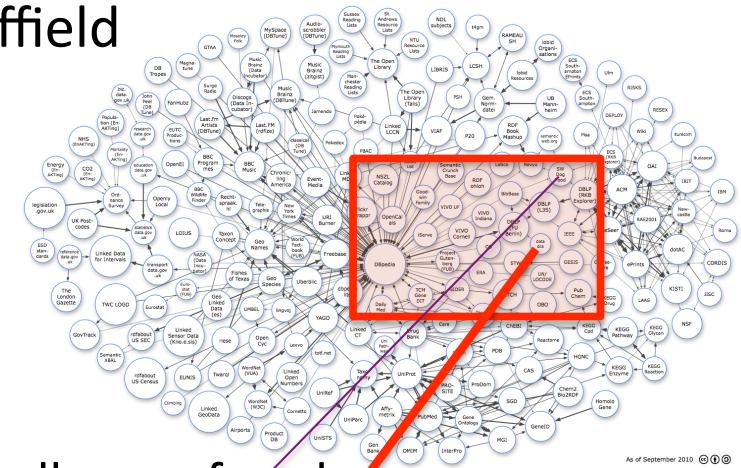

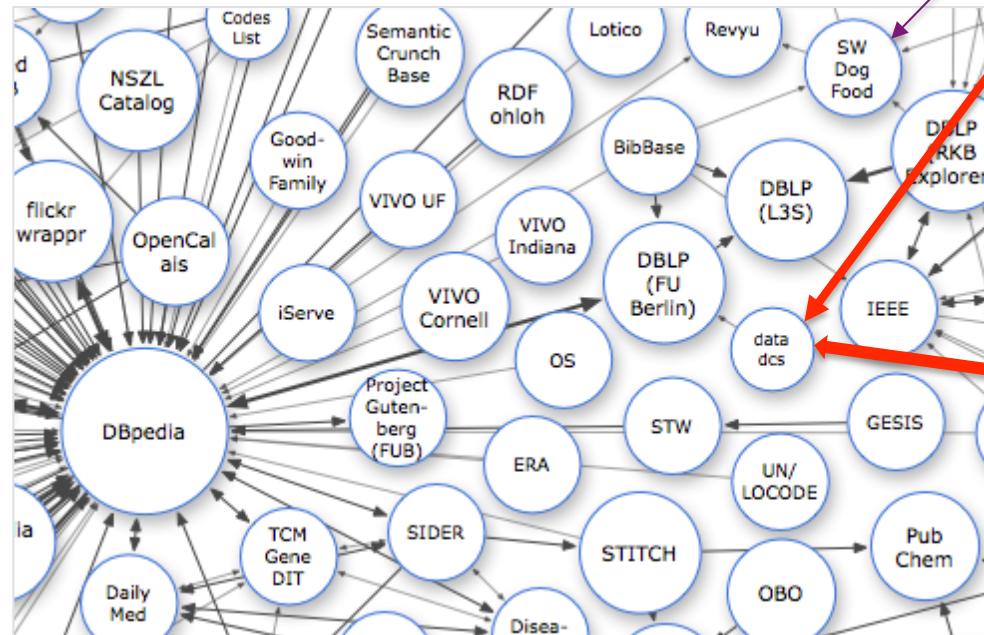

- where end users broadly classified into one of:
 - Semantic Web experts
 - web-savvy but non-technical

Outline

- Challenges
- **Illustrative Scenario**
 - Existing Work
 - Approach
 - Initial Evaluation
 - Conclusions & Next Steps
- Acknowledgements

Sample dataset - Data.dcs

- research groups in DCS, University of Sheffield
- ontologies (re)used
 - FOAF, PRV, SWRC, BIB
- by Linked Data standards very small
 - over 8000 statements
 - ~3000 (distinct) graph nodes
 - however still highlights the scale of the challenges faced

Scenario

- Information-seeking scenario
 - end user: a primary school teacher
 - task: looking for research in local university on ‘Web Technology’
 - tools typically used for information seeking activities:
 - web search/browse
 - library
- consider the university department’s web site built on top of *Data.dcs*

Outline

- Challenges
- Illustrative Scenario
- **Existing Work**
- Approach
- Initial Evaluation
- Conclusions & Next Steps
- Acknowledgements

Tools for consuming Linked Data

- Semantic Web user
 - well catered for
 - typical tasks
 - browsing RDF
 - validating data and models
 - extracting data using formal query syntax
- mainstream web user
 - lower tool support
 - typical tasks - exploratory information seeking
 - search and query (using less formal methods, e.g., forms)
 - browsing to discover information
 - sharing of information discovered, results of any analysis

Tools for consuming Linked Data

Tool Type	Examples of Tools
formatted text display of RDF (e.g., using HTML tables, templates)	<i>Sig.ma, Marbles, URI Burner, Haystack, Tabulator</i>
RDF graph model	<i>W3C RDF Validator, Sindice Inspector</i>
other graph visualisation	<i>IsaViz, RDFGravity, Cytoscape, RelFinder</i>
other domain-specific visualisation	<i>DBpedia Mobile, Talis Research Funding Explorer</i>

Expected Skill Set	Examples of Tools
understanding of SW technology stack	<i>Sig.ma, Marbles, URI Burner, W3C RDF Validator, RelFinder, Tabulator</i>
formal querying, e.g., SPARQL	<i>LESS</i>
basic to advanced knowledge seeking, exploratory navigation	<i>DBpedia Mobile, RelFinder, Talis RFE, IsaViz</i>
web browsing (desktop, mobile)	<i>LESS, DBpedia Mobile</i>

A Template-based Solution

- taking advantage of self-describing RDF data
 - look up class of a given resource
 - load template based on class – i.e., rdf:type of the instance
- focus on pertinent information in a dataset
- highlight relationships within data
- allow end users to retrieve detail in ROIs (regions of interest)
- combine templates with information/knowledge visualisation
 - hide the complexity of the underlying data
 - remove the need for specialist SW knowledge or skill

Why this approach?

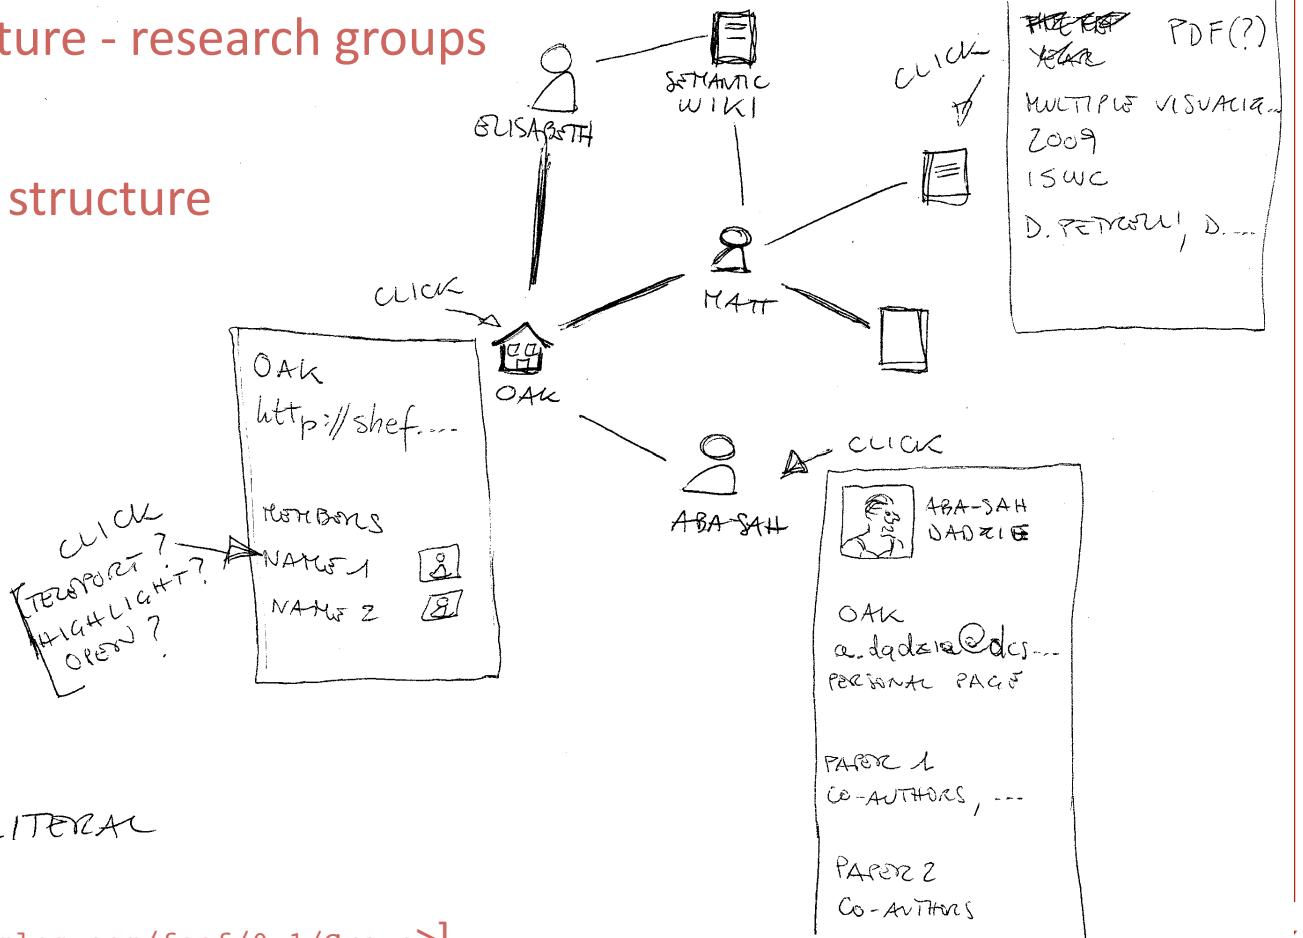

- Templates
 - value seen in the wide use of *Fresnel lenses* and other template development tools and languages, e.g., *IsaViz*, *LENA*, *LESS*
 - simplicity, reusability, extensibility, flexibility
- Visualisation
 - overview to support detection of data structure
 - exploratory information seeking
 - identifying/highlighting relationships
 - recognising anomalies, errors
 - reduction in cognitive load – through advanced human perception
 - especially useful for analysis of large, complex data

Template Design

- identify key concepts & relevant metadata to define templates
 - match to standard ontologies, e.g., FOAF, PRV, SWRC, BIB
 - SPARQL queries – built based on Fresnel lens SPARQL selectors
- presentation methods
 - visual overview - node-link graph
 - collapse information related to key concepts into compound nodes
 - filter out less immediately relevant data – provide more room for ROIs
 - visual encoding
 - colour coding based on RDF type (nodes and links)
 - icons based on RDF type (nodes)
 - size to encode node properties, e.g., no. of outlinks
 - detail view
 - text and thumbnails/icons

Data.dcs templates

- information of main interest – key concepts
 - organisational structure - research groups
 - people
 - relationships within structure

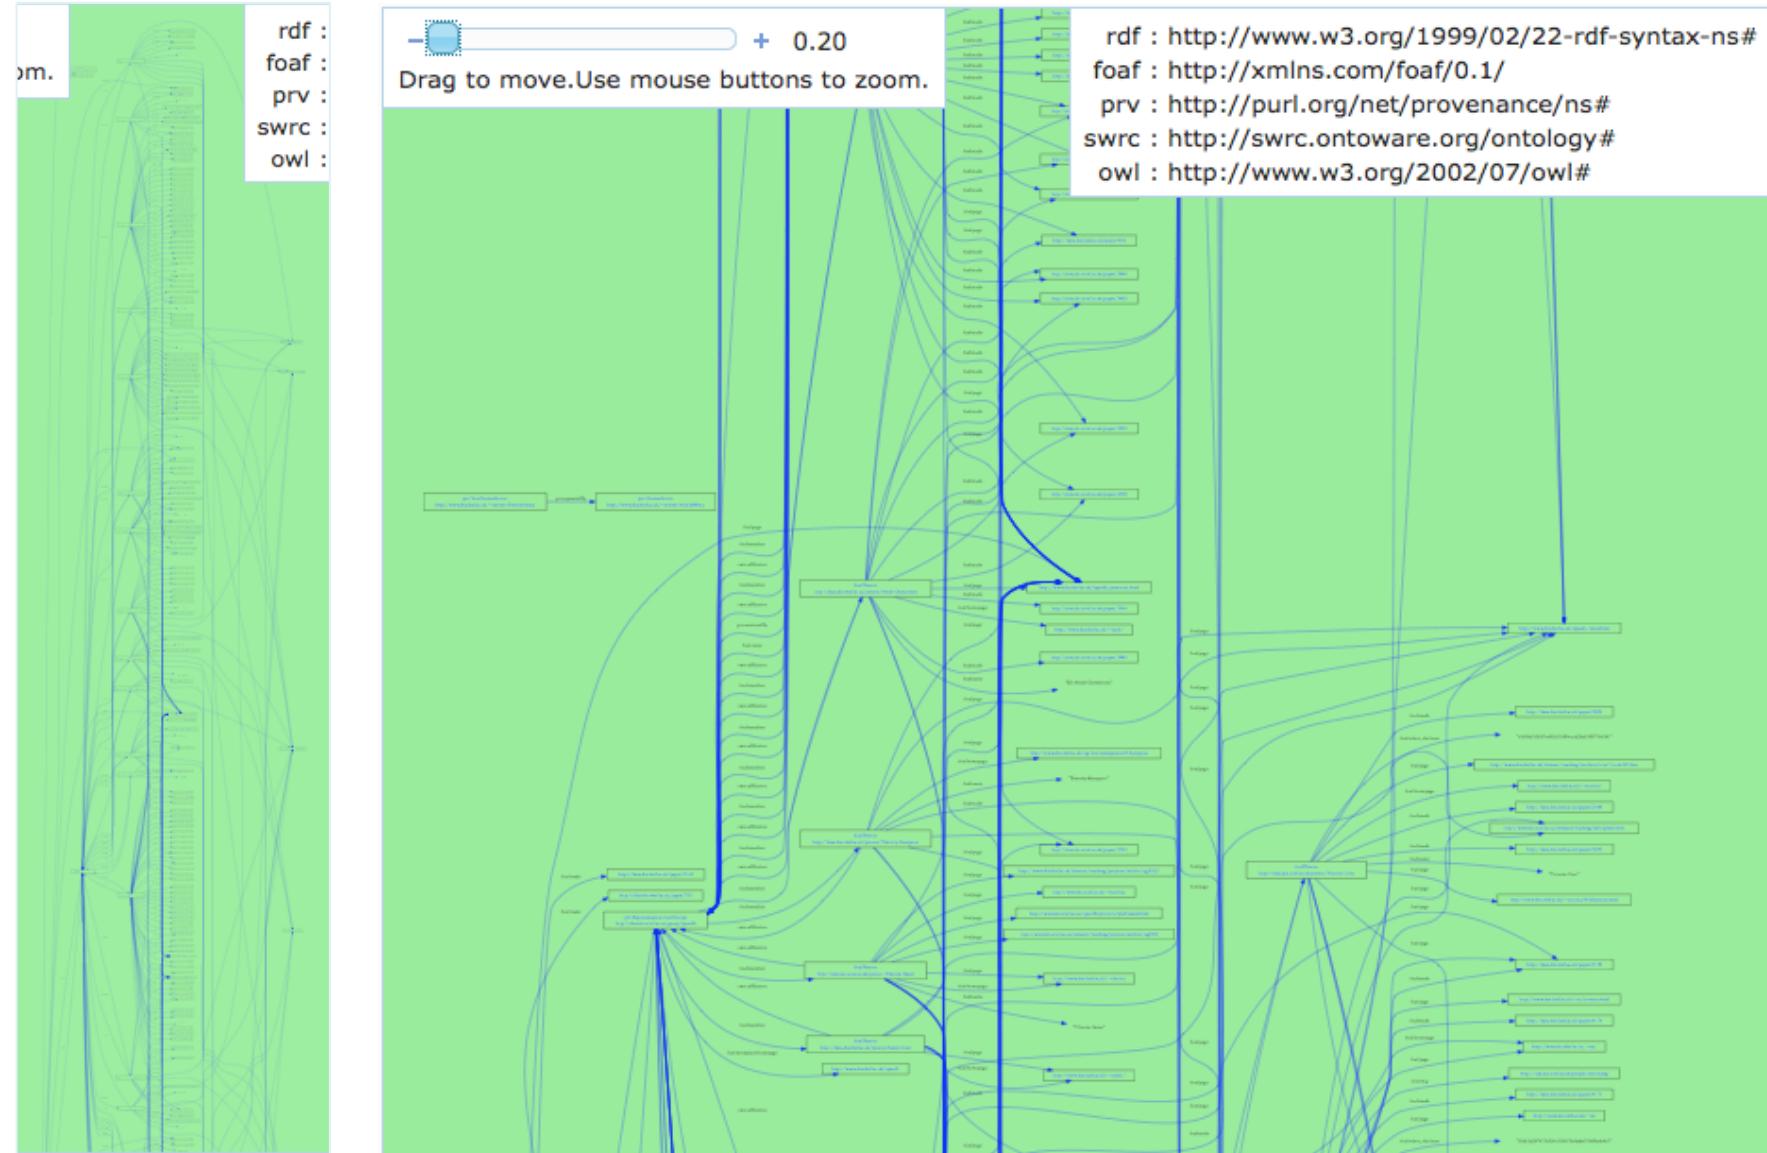

- main concepts
 - **Organisation** [<http://xmlns.com/foaf/0.1/Group>]
 - **Person** [<http://xmlns.com/foaf/0.1/Person>]
 - **Publication** [<http://zeitkunst.org/bibtex/0.1/bibtex.owl#Entry>]

Challenge 1: Combating information overload

- very large amounts of distributed, heterogeneous data
- high inter-linking

Data.dcs – RDF graph

Drawn using Sindice Inspector – first 1000 triples only for usability reasons

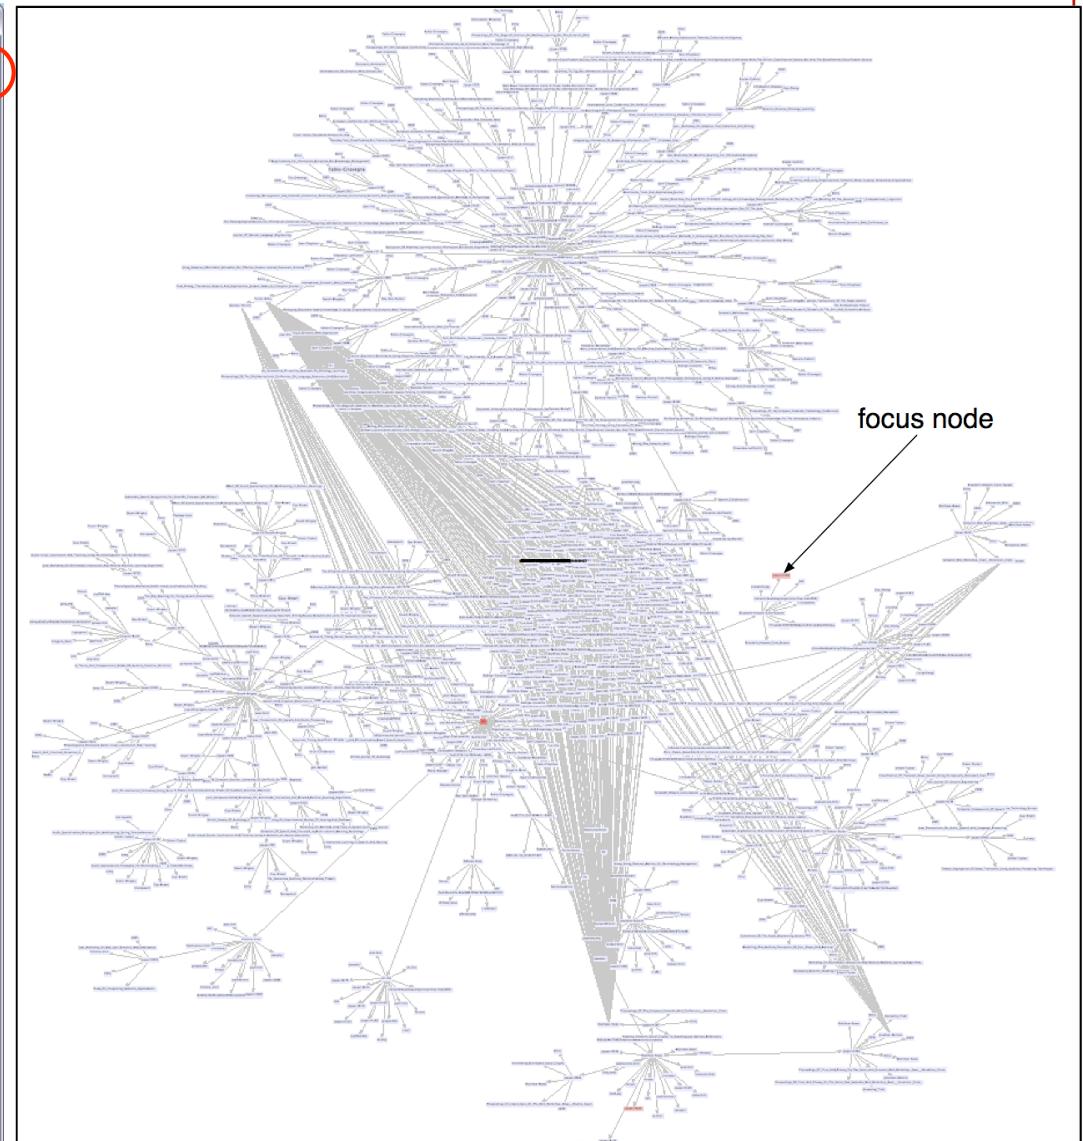

Data.dcs - RDF Text vs Basic Graph

Data.dcs – Template Graph View

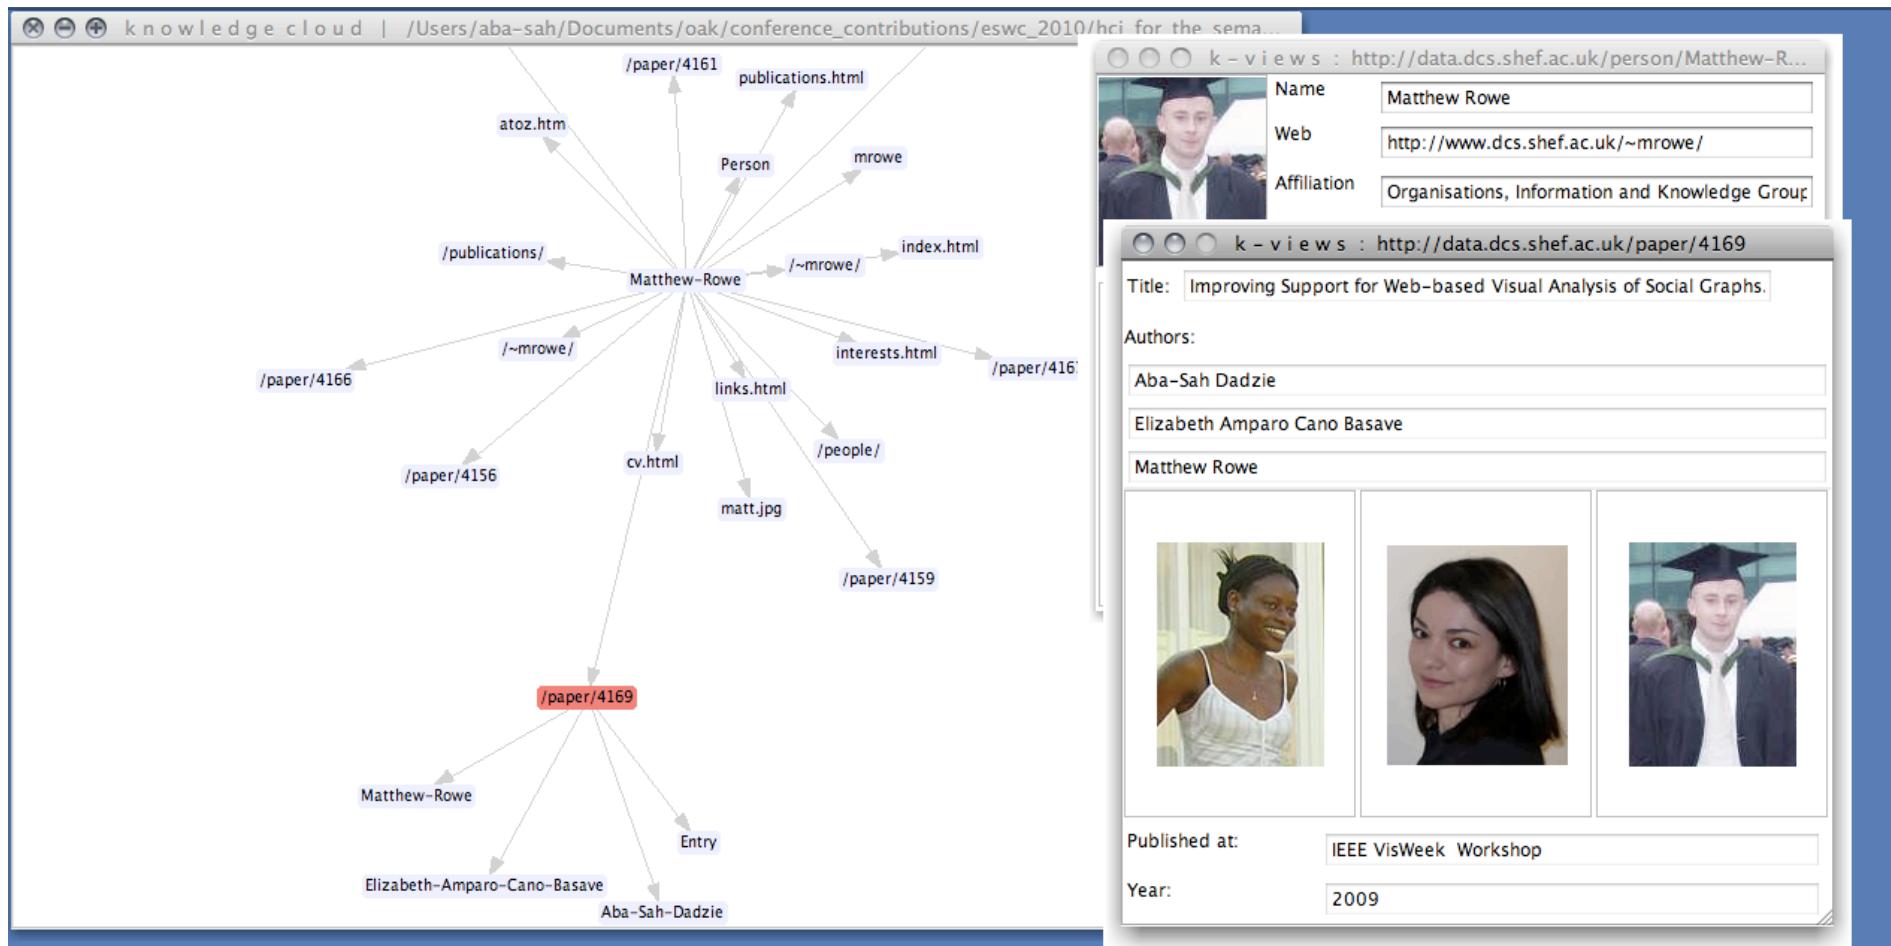

Challenge 1: Solution Proposed

- **Combating information overload**
 - very large amounts of distributed, heterogeneous data
 - high inter-linking
- our solution:
 - visual overview + filters
 - highlighting key relationships
 - detail view
 - focus on graph ROI within context of surrounding data
 - + text detail & thumbnails or representative icons

Challenge 2: Exploration starting point

- SW users
 - may have a specific URI to explore
- mainstream users
 - may or may not have a specific starting point
 - often start with a vague idea and browse to find if there is anything interesting

Design ideas: Detail templates

Challenge 2: Solution proposed

- **Exploration starting point**
 - SW users
 - may have a specific URI to explore
 - mainstream users
 - may or may not have a specific starting point
 - often start with a vague idea and browse to find what they want
- **our solution:**
 - support both
 - where input, specific URI as focus at start
 - extract list of potential start points
 - selected from key RDF types in a dataset
 - randomly chosen focus – influenced by context
 - centre graph on focus

Challenge 3: Returning something *useful*

- what is the end user looking for?
- how can we present the data so they are able to find it?

Challenge 3: Solution

- **Returning something *useful***
 - what is the end user looking for?
 - how can we present the data so they are able to find it?
- Our solution
 - graph overview + detail template view
 - reuse familiar web browser look and feel (detail)
 - interactive graph
 - to support exploratory navigation
 - retain context of surrounding information
 - colour coding to highlight key resource types and relationships

Challenge 4: Enabling interaction

- Our solution
 - graph overview + detail template view
 - reuse familiar web browsing interaction
 - click to navigate through data (in both views)
 - pan + zoom for graph view
 - filters to remove less relevant information

Outline

- Challenges
- Illustrative Scenario
- Existing Work
- Approach
- **Initial Evaluation**
- Conclusions & Next Steps
- Acknowledgements

Formative Evaluation

- at ESWC 2010 ‘Essential HCI for the Semantic Web’ tutorial
 - focus group of (14) “expert reviewers”
 - assessing usability for both mainstream and expert users
 - training task and an information exploration exercise
- graphs found to be expressive
- graph view effective in giving a sense of data distribution
- detail view effectively displayed key resources “*in a neat and concise way*”
- prototype seen to have potential for exploring and debugging LD
- some difficulty for users not familiar with interactive graph layout
 - “*eventually you got a big picture of the data*”
 - “*I liked the direct manipulation but the graph should stay put [when I click]*”

Outline

- Challenges
- Illustrative Scenario
- Existing Work
- Approach
- Initial Evaluation
- **Conclusions & Next Steps**
- Acknowledgements

Conclusions

- explored human-centred solution for consuming Linked Data
 - exploiting templates (via SW technology)
 - combined with visualisation
- evaluation highlighted challenges still remaining - among others:
 - scale
 - complexity
- however – promising start....
- **Next Steps**
 - more user control - (intuitive) support for defining templates, filters
 - dynamic update with new Linked Data
 - formal usability evaluation with wider range of users

Outline
