#### **ICAPS 2011**

## **IPPC** Results Presentation

Scott Sanner

Sungwook Yoon

Additional domain development by Tom Walsh (ASU)

# Main Objective for IPPC 2011

#### More realistically motivated problems

- PPDDL cannot represent many probabilistic domains
  - Traffic Control
  - Elevator Control
  - Mars Rovers

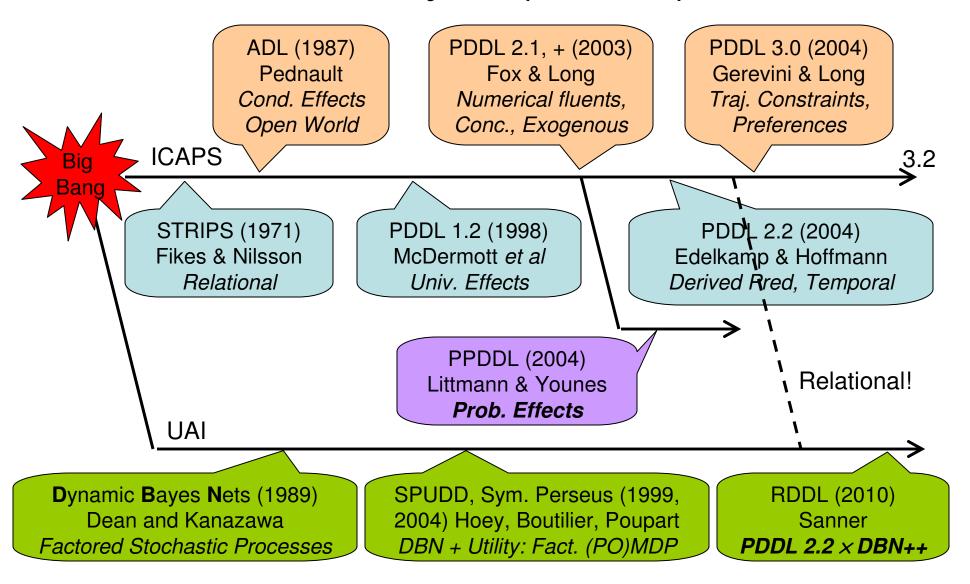

#### Needed

- $\rightarrow$  concurrency
- → independent exogenous effects
- → continuing processes and non-goal rewards
- → partial observability
- → distributions that are complex function of state
- → enumerated, integer, continuous variables (no competitors)

#### - Required a new language

RDDL (new lifted DBN transition semantics)

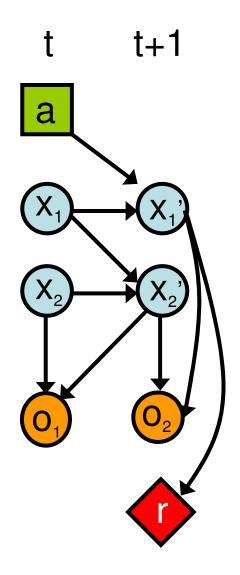

## A Brief History of (ICAPS) Time

PDDL history from: <a href="http://ipc.informatik.uni-freiburg.de/PddlResources">http://ipc.informatik.uni-freiburg.de/PddlResources</a>

#### What is RDDL?

- Relational Dynamic Influence Diagram Language
  - Relational[DBN + Influence Diagram]
  - Everything is a fluent!
    - states
    - observations
    - actions
    - derived (stochastic) predicates
  - Uniform expression language

# Other Objectives for IPPC 2011

- Translations to draw in different communities
  - Factored MDP / POMDP community
  - ICAPS PPDDL community
  - 11 competitors!
- Single normalized evaluation criteria
  - Previously
    - plan length
    - goal %
    - planner time

(skipping hard problems could increase domain averages)

# RDDLSim Software

Open source & online at

http://code.google.com/p/rddlsim/

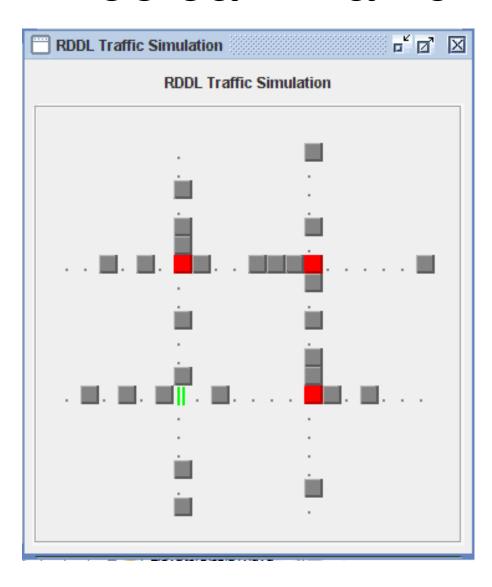

#### RDDL Software Overview

- BNF grammar and parser
- Simulator
- Automatic translations
  - LISP-like format (easier to parse)
  - SPUDD & Symbolic Perseus (boolean subset)
  - Ground PPDDL (boolean subset)
- Client / Server
  - Java and C/C++ sample clients
  - Evaluation scripts for log files
- Visualization
  - DBN Visualization
  - Domain Visualization see how your planner is doing

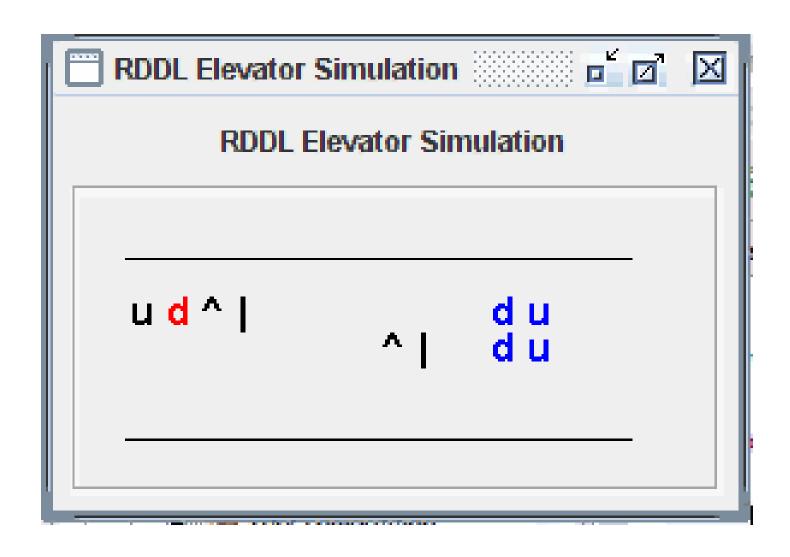

## Domains and Evaluation

- Eight domains
  - Traffic Control: exogenous, concurrent
  - Elevator Control: exogenous, concurrent
  - Game of Life: highly combinatoric
  - SysAdmin: exogenous, complex transitions
  - Navigation: goal-oriented, determinization killer
  - Crossing Traffic: goal-oriented, deterministic if move far left
  - Skill Teaching: relatively sparse transitions
  - Reconnaissance: relatively sparse transitions
- 10 instances per domain
- No discount, finite horizon of 40
- Average normalized score [0,1]
  - Min: random / noop
  - Max: best competitor
  - Scores < 0 set to 0</p>

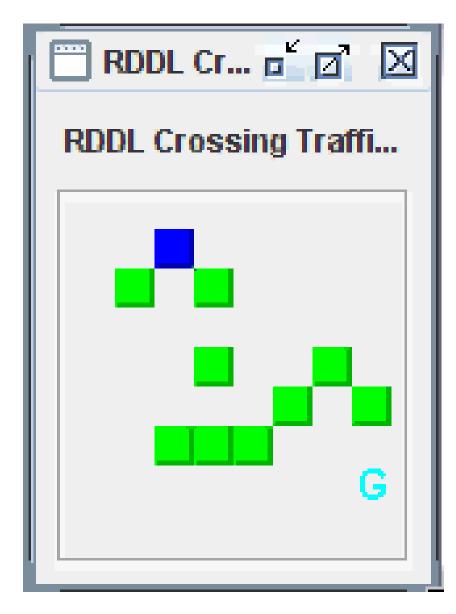

# **Boolean Traffic**

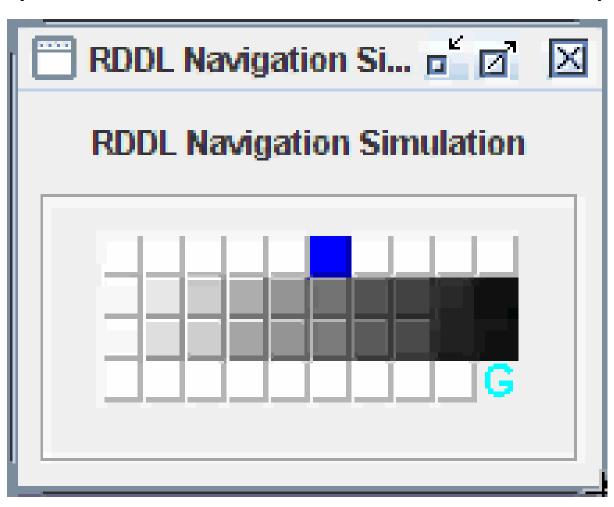

## **Boolean Elevators**

# Crossing Traffic (aka Frogger)

# Navigation (aka deteminization killer)

# Competition Format

- Amazon EC2 (Elastic Compute Cloud)
  - 11 instances on demand
    - Ensures everyone has same computational power
    - Everyone has admin access to their machines
  - Just pay for time used
    - received an Amazon EC2 grant of \$1000 for competition
    - so running it was free
  - → Highly recommended for future competitions!!!

# Competitors: Boolean MDP Track

| Competitors  | Algorithm                                     |
|--|---|
| PROST<br>(Eyerich, Keller – Uni. Freiburg)         | UCT/Single Outcome Determinization, Caching   |
| Glutton<br>(Kolobov, Dai, Mausam, Weld – UW)       | Iterative Deepening RTDP, Caching             |
| MIT-ACL<br>(Ure, Toksoz, Redding, Gemifard – MIT)  | RL / Linear Fun. Approx,<br>Feature Discovery |
| Beaver<br>(Nadamuni, Joshi, Fern, Tadepalli – OSU) | UCT, SPUDD Guidance                           |
| SPUDD<br>(Zhu, Grzes, Hoey – Uni. Waterloo)        | Value Iteration with ADDS                     |

## Results: Boolean MDP Track

1st Place: PROST

2<sup>nd</sup> Place: Glutton

Additional standard error analysis on non-truncated scores shows separation

| PROST (Eyerich, Keller)                   | 0.902 | ± 0.07<br>± 0.03 |
|---|-------|------------------|
|   | 0.902 | ± 0.03           |
| Glutton (Kolobov, Dai, Mausam, Weld)      | 0.815 | ± 0.07           |
|   | 0.812 | ± 0.03           |
| MIT-ACL (Ure, Toksoz, Redding, Gemifard)  | 0.109 | ± 0.06           |
| Beaver (Nadamuni, Joshi, Fern, Tadepalli) | 0.047 | ± 0.04           |
| SPUDD (Zhu, Grzes, Hoey)                  | 0.016 | ± 0.02           |

# Competitors: Boolean POMDP Track

| Competitors                                   | Algorithm                                    |
|---|--|
| POMDPX_NUS<br>(Wu, WS Lee)                    | SARSOP / UCT<br>(POMCP)                      |
| KAIST-AILAB<br>(D Kim, K Lee, K-E Kim)        | Symbolic HSVI (ADDs),<br>Symmetry Detection  |
| HyPlanClient<br>(Borera, Pyeatt)              | ~RTDP-Bel                                    |
| POND<br>(Bryce, Olsen)                        | Translation to Conf. Planning, Hindsight Opt |
| Symbolic Perseus<br>(Poupart, Hoey, Morrison) | PBVI with ADDs                               |
| McGill<br>(Png, Ong, Pineau)                  | UCT (POMCP)                                  |

#### Results: Boolean POMDP Track

- Distinguished 1<sup>st</sup>: POMDPX\_NUS
- Tie for 1<sup>st</sup> (within 95% stderr): KAIST-AILAB

| POMDPX_NUS (Wu, WS Lee)                       | 0.559 | ± 0.10 |
|---|-------|--------|
| KAIST-AILAB (D Kim, K Lee, K-E Kim)           | 0.529 | ± 0.19 |
| HyPlanClient (Borera, Pyeatt)                 | 0.175 | ± 0.08 |
| POND (Bryce, Olsen)                           | 0.161 | ± 0.06 |
| Symbolic Perseus<br>(Poupart, Hoey, Morrison) | 0.124 | ± 0.07 |
| McGill (Png, Sylvie Ong, Joelle Pineau)       | 0.036 | ± 0.03 |

# Thanks to All Competitors!
