

# Log-based Predictive Maintenance

Ruben Sipos, Cornell U.

Dmitriy Fradkin, Siemens

Fabian Moerchen, Amazon

**Zhuang (John) Wang, Skytree**

(work performed while all authors were employed by Siemens Research in Princeton, NJ)

# Log-based Predictive Maintenance

- Helps determine the running condition of in-service equipment to predict when and where repairs should be performed

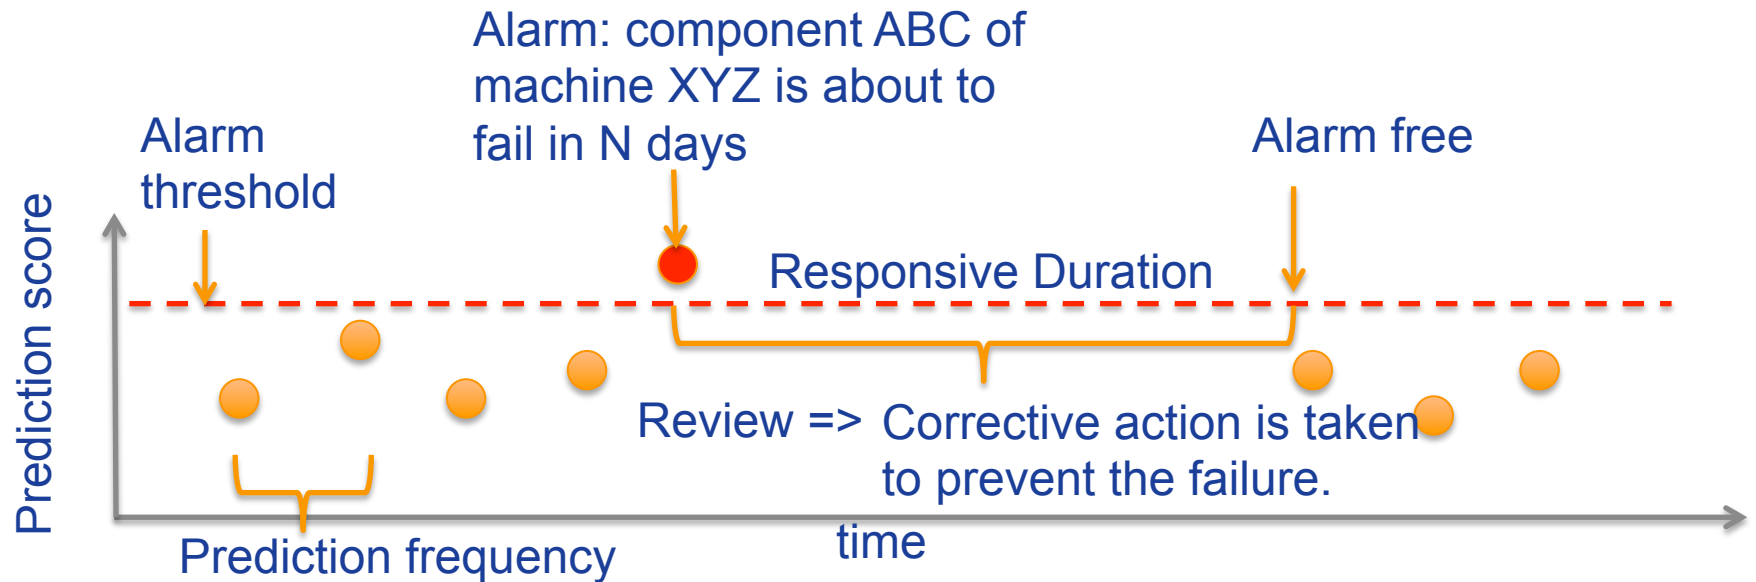

Logs from various software applications record detailed operations of equipment

```
2012-09-08 21:21:09 CT_ITH 2 IRS scan information: Topo tot Rdg: 6460, defects: HV-Drop 0, HI

```

Mining logs helps in detecting potential issues in advance.

# How is Model Used in Real-life?

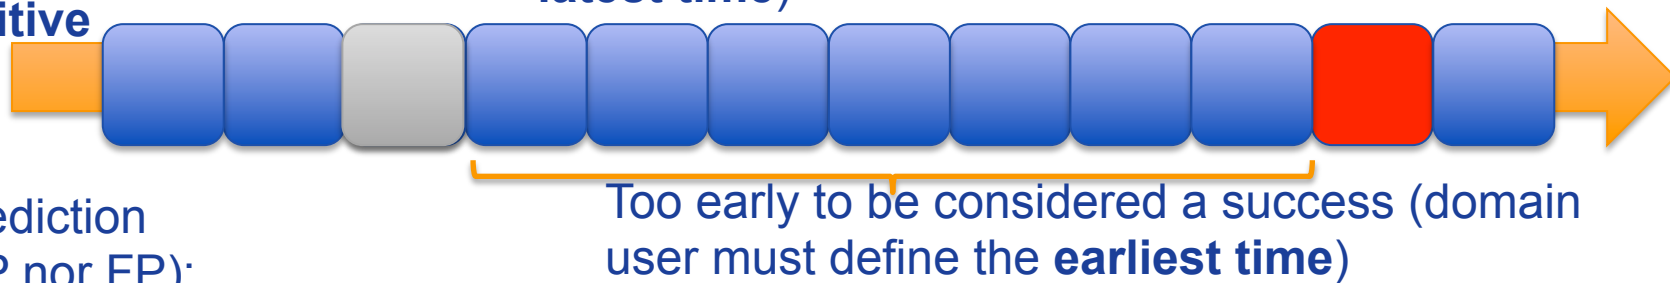

# How is Model Evaluated in Real-life?

**True positive**  
example:

**False positive**  
example:

**Invalid prediction**  
(neither TP nor FP):

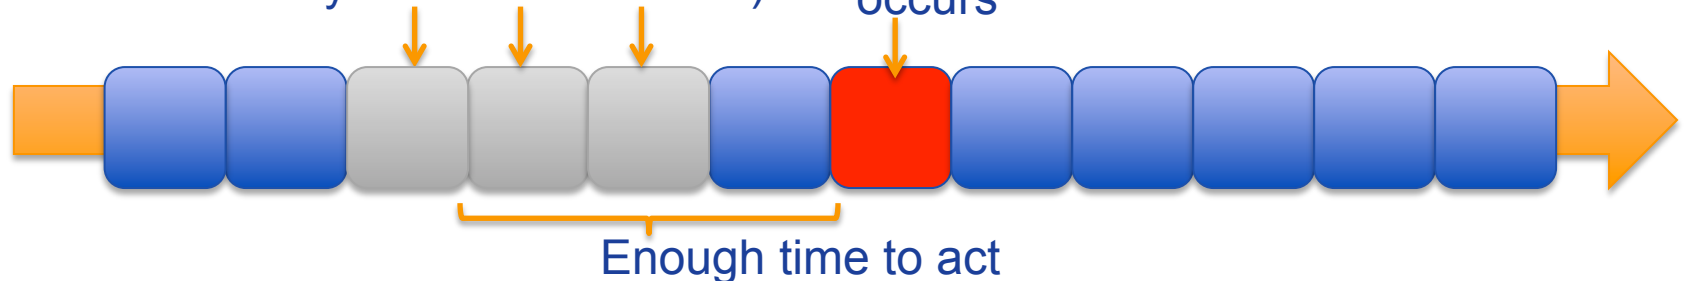

# How is Model Evaluated in Real-life? (cont.)

## Counting of TP/FP:

3 true alerts but only count 1 TP (1 failure can only have at most 1 TP)

A failure occurs

2 false alerts but only count 1 FP (1 Responsive Duration can only have at most 1 FP)

- **Recall:** TP/ All failures
- **Precision:** TP/ (TP+ FP)
- **Predictive-Maintenance-based AUC (PM-AUC):** computed like regular PR-AUC but using the above defined TP and FP.

# Service Data: the Y

- Service data records details of performed services:
  - service open/close date
  - equipment id
  - component replacement
  - ...

- Not always correct but reasonable assumption:  
**a component replacement is the consequence of the component failure**

We can use historical service data to correlate any known component failure with its corresponding equipment, time and relevant logs.

# The Methodology

**We propose a simple but effective algorithm for the resulting MIL problem with imbalanced labels and high-dimensional features**

# Domain-based Evaluation Results

- Data

	Dataset C	Dataset A
# instances	181,945	422,560
# failures	88	108
# features	6,664	14,367

- Competing MIL algorithms
  - AllInstance (ICML, 2005)
  - Aggregated
  - MILES (PAMI, 2006)
  - MI-SVM (NIPS, 2003)

PM-AUC comparison (bag-level 5 CV with stratified sampling):

	<i>C</i>	<i>A</i>
random	0.037 (0.004)	0.017 (0.003)
AllInst.	0.293 (0.014)	0.620 (0.013)
Agg.	0.174 (0.013)	0.498 (0.016)
MILES	0.170 (0.011)	0.427 (0.117)
MI-SVM	0.216 (0.038)	0.700 (0.014)
Ours	<b>0.319 (0.015)</b>	<b>0.730 (0.011)</b>

# PM-ROC with Different Model Complexity

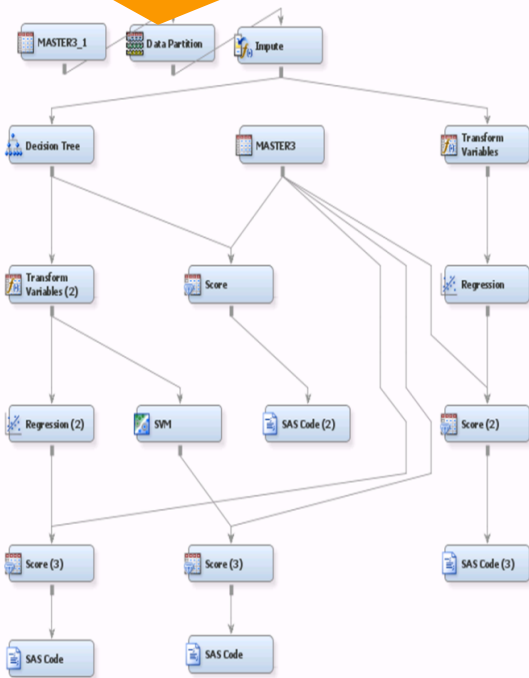

See more results in paper:

- **On Utility of Single Features**
- **Local vs Global Models**

# Deployment

- Guided the client in implementing the approach on SAS platform.

Re-implemented the approach in SAS EM workflow
